Load Case	Description	Loading
LC01	Usual - Empty Reservoir, Winter	Dead + Earth + Uplift + Wind + Snow
LC02	Usual - Empty Reservoir, Summer	Dead + Earth + Uplift + Wind
LC03	Unusual - Construction	Dead + Earth + Uplift + Wind + Surcharge
LC04	Unusual - 10-Year Flood	Dead + Earth + Hydro + Uplift + Wind
LC05	Extreme - 10-Year Flood + Impact	Dead + Earth + Hydro + Uplift + Wind + Impact
LC06	Extreme - Maximum Pool	Dead + Earth + Hydro + Uplift
LC07	Extreme - Earthquake	Dead + Earth + Wind + Uplift + EQ[1]
LC08	Post-Earthquake	Dead + Earth + Uplift + Wind

1 Response Spectrum Analysis; EQ=max [24 combinations of EQx, EQy, EQz]

INTAKE TOWER STATIC STABILITY ANALYSIS SUMMARY

Job Name:	Springbank Off-Stream Storage Project	Number:	110773396
Site:	Intake Structure	Originator:	CG 7/2/2020

Results Summary:

SR-1 - Summary of Intake Structure Static Stability Assessment

Load Case	Load Category	Sliding Stability Safety Factor		Base Area in Compression(2)		Bearing Pressures (3) (kPa)		Flotation Safety Factor	
		Required	Calculated	Required	Calculated	Req.	Max Calc.	Required	Calculated
1- Empty Reservoir, Winter	Usual	1.5	**17**	100%	**100%**	200.0	**133.0**	1.5	**8.8**
2- Empty Reservoir, Summer	Usual	1.5	**17**	100%	**100%**	200.0	**132.3**	1.5	**8.7**
3- Construction	Unusual	1.3	**8**	100%	**100%**	200.0	**142.3**	1.3	**9.2**
4- 10-Year Flood	Unusual	1.3	**14**	100%	**100%**	200.0	**120.3**	1.3	**2.2**
5- 10-Year Flood + Impact	Extreme	1.1	**7**	75%	**100%**	200.0	**131.2**	1.1	**2.2**
6- 10-Year Flood + Clogged Trashracks	Unusual	1.3	**12**	100%	**100%**	200.0	**102.0**	1.3	**2.0**
7- Maximum Pool	Extreme	1.1	**9**	75%	**100%**	200.0	**103.0**	1.1	**1.3**

(1)- Direction of wind and wave loads do not apply when the structure is submerged.

(2)- 100% base compression = resultant within the middle 1/3

75% base compression = resultant within the middle 1/2

>0% base compression = resultant within the base

(3)- Bearing pressure limits are based on the allowable bearing capacity of the foundation soils

INTAKE TOWER STABILITY ANALYSIS

Job Name:	Springbank Off-Stream Storage Project (SR-1)	Number:	110773396		
Site:	Intake Structure	Originator:	CG 7/2/2020	Checker:	ACG
Load Case:	1 Empty Reservoir, Winter				

Input Data:

Footing Data:

Footing Length, L =	7.90	m
Footing Width, B =	6.30	m

STABILITY ANALYSIS FOR CANTILEVER WALL WITH KEY

Project / Client: Springbank Off-Stream Storage (SR1) / Alberta Transportation

Section Location: Intake Structure Wing Wall - Closest to Intake Structure

1.0 OBJECTIVE

For a particular load condition, analyze a reinforced concrete cantilever wall with shear key for overturning, sliding, flotation, and bearing capacity in accordance with criteria described in the listed references.

2.0 BACKGROUND INFORMATION

2.1 DATA SOURCES

1- Soils Report - Recommended Geotechnical Soil Parameters, SR-1 Low Level Outlet (LLO) Structures. July 19, 2019

2- Drawings - Design Drawings

3- Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM) , 2019

2.2 REFERENCES

1. (CDA) Dam Safety Guidelines, 2007 (revised 2013).
2. "Water Control Structures Selected Design Guidelines," Alberta Transportation & Alberta Environment, Calgary Alberta, November 2004.

3.0 DESIGN PARAMETERS AND CRITERIA

3.1 Stability Analysis Criteria (Data source 2)

Load Case	$LC := 1$
Load Case Description	$vlookup(LC, CASES, 1)_0 = $ "Empty Reservoir"
Sliding Minimum Factor of Safety	$FS_{Sliding} := vlookup(LC, CASES, 2)_0 = 1.5$
Overturning Criteria	$Base\_Comp_{Req} := vlookup(LC, CASES, 3)_0 = 100 \cdot \%$
Bearing Capacity Minimum Factor of Safety	$FS_{Bearing} := vlookup(LC, CASES, 4)_0 = 1$
Flotation Minimum Factor of Safety	$FS_{float} := vlookup(LC, CASES, 5)_0 = 1.5$

3.2 Material Properties - Data Source 1 Unless Otherwise Noted

Unit Weight of Water	$\gamma_w := 9.81 \frac{kN}{m^3}$	
Unit Weight of Concrete	$\gamma_c := 23.5 \cdot \frac{kN}{m^3}$	Data Source 3
Unit Weight of Soil (Moist)	$\gamma_{soilm} := 20 \frac{kN}{m^3}$	
Soil Unit Weight Beneath Base (Saturated)	$\gamma_{soilsat} := 20 \frac{kN}{m^3}$	
Soil Cohesion - Drained	$c_{soil} := 0kPa$	
Soil Angle of Internal Friction - Drained	$\phi_{soil} := 24deg$	
Soil Ultimate Bearing Pressure	$Q_b := 150kPa$	
Slope of backfill (Conservative)	$\beta := 0$	
At-rest lateral earth pressure coefficient	$k_o := 1 - \sin(\phi_{soil}) = 0.59$	

4.0 WALL SECTION DESCRIPTION

4.1 Point Locations (Refer to Figure 1 and Drawings)

A - Top of wall	$EL_A := 1189.9m$	$x_A := 3.25m$
B - Top of fill - reservoir side	$EL_B := 1189.75m$	$x_B := x_A = 3.25 \cdot m$
C - Top of Heel	$EL_C := 1187m$	$x_C := x_A = 3.25 \cdot m$
D - Heel side end of footing	$EL_D := EL_C - 500mm = 1186.50\ m$	$x_D := x_A = 3.25 \cdot m$
E - Toe side end of footing	$EL_E := EL_D = 1186.50 \cdot m$	$x_E := 0m$
F - Top of Fill - land side	$EL_F := EL_C + 0.333m = 1187.33 \cdot m$	$x_F := x_E = 0$
G - Heel side face of wall stem	$EL_G := EL_A = 1189.90 \cdot m$	$x_G := 1.25m$
H - Toe side face of wall stem	$EL_H := EL_A = 1189.90 \cdot m$	$x_H := x_G - 0.500m = 0.75 \cdot m$

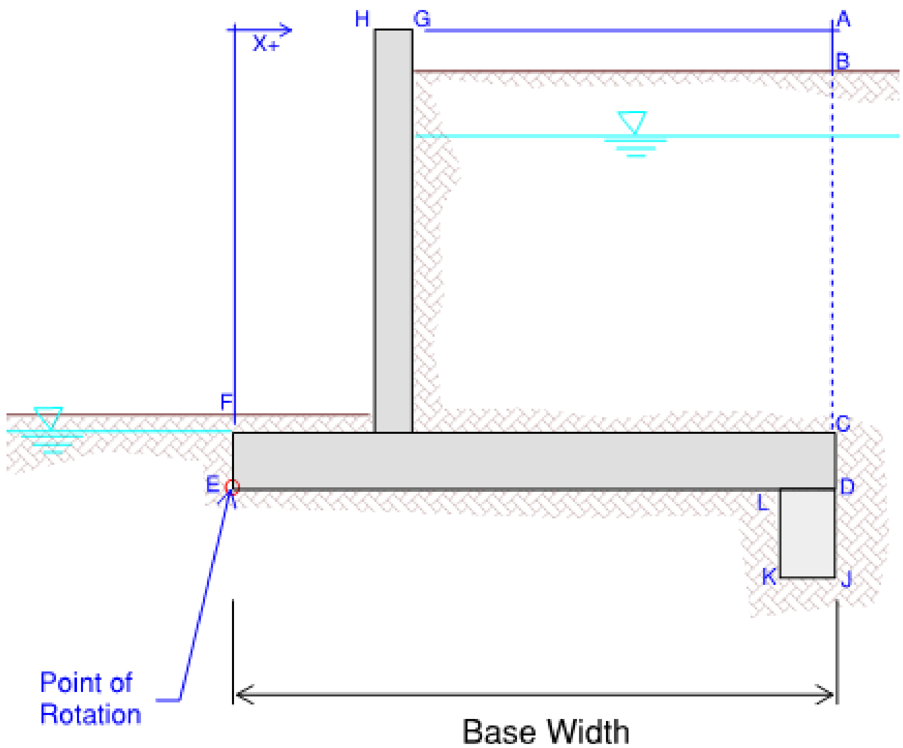

Figure 1. Cantilever Wall Section

J - Bottom of key - heel side	$EL_J := EL_C - 2m = 1185.00 \cdot m$	$x_J := x_D = 3.25\,m$
K - Bottom of key - toe side	$EL_K := EL_J = 1185.00 \cdot m$	$x_K := x_J - 450mm = 2.8 \cdot m$
L - Top of key	$EL_L := EL_D = 1186.50 \cdot m$	$x_L := x_K = 2.8\,m$

Applied Loads Data Source 2

Heel side water elevation

$$EL_{hw} := \begin{cases} EL_B & \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 1)_0 \cdot 1m\right) & \text{otherwise} \end{cases} = 1187$$

Toe side water elevation

$$EL_{tw} := \begin{cases} EL_F & \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 2)_0 \cdot 1m\right) & \text{otherwise} \end{cases} = 1187$$

Equivalent soil surcharge:

$$h_{sur} := \begin{cases} 1.0m & \text{if } LC = 2 \\ 0 & \text{otherwise} \end{cases} = 0 \cdot m$$

4.2 Additional Analysis Dimensions

Analysis Width	$b := 1m$
Length of base	$L_{base} := x_D - x_E = 3.25 \cdot m$
Thickness of base	$t_{base} := EL_C - EL_D = 500 \cdot mm$
Length of stem	$L_{stem} := EL_A - EL_C = 2.9 \cdot m$
Thickness of stem	$t_{stem} := x_G - x_H = 500 \cdot mm$
Length of Heel	$L_{heel} := x_A - x_G = 2000 \cdot mm$
Length of Toe	$L_{toe} := x_H - x_F = 750 \cdot mm$
Thickness of Key	$t_{key} := x_J - x_K = 450 \cdot mm$
Height of Key	$h_{key} := EL_D - EL_J = 1500 \cdot mm$

5.0 UPLIFT & HYDROSTATIC LOADS

5.1 Uplift Pressures for Sliding Stability Analyses

Determine water pressures for designated coordinates using full headwater uplift pressure at the heel and full tailwater uplift pressure at the toe. Uplift distribution is assumed linear from heel to toe.

Hydrostatic pressure at Heel	$u_h := \gamma_w \cdot \left(EL_{hw} - EL_J\right) = 20 \cdot kPa$
Hydrostatic pressure at Toe	$u_t := \gamma_w \cdot \left(EL_{tw} - EL_E\right) = 5 \cdot kPa$
Total uplift loads on base	$P_u := \frac{\left(u_h + u_t\right)}{2} \cdot L_{base} \cdot b = 39.85 \cdot kN$
Uplift resultant location	$x_u := \frac{L_{base}}{2} + \frac{L_{base}}{6} \cdot \frac{\left(u_h - u_t\right)}{u_t + u_h} = 1.95 \cdot m$
Uplift Moment about Toe	$M_u := P_u \cdot x_u = 77.7 \cdot kN \cdot m$

5.2 Headwater Hydrostatic Load - Heel Side

Headwater hydrostatic load $P_{hw} := \frac{1}{2} u_h \cdot (EL_{hw} - EL_J) \cdot b = 19.6 \cdot kN$

Headwater moment arm $y_{hw} := \frac{1}{3}(EL_{hw} - EL_J) - h_{key} = -0.83 \cdot m$

Headwater Moment about Toe $M_{hw} := P_{hw} \cdot y_{hw} = -16.4 \cdot kN \cdot m$

5.3 Tailwater Hydrostatic Load - Toe Side

Tailwater hydrostatic load $P_{tw} := \frac{1}{2} \gamma_w \cdot (EL_{tw} - EL_K)^2 \cdot b = 19.62 \cdot kN$

Tailwater moment arm $y_{tw} := h_{key} - \frac{1}{3}(EL_{tw} - EL_K) = 0.83 \cdot m$

Tailwater Moment about Toe $M_{tw} := P_{tw} \cdot y_{tw} = 16.35 \cdot kN \cdot m$

6.0 LATERAL EARTH PRESSURE

6.1 Lateral Soil Load on Toe Side

Soil pressure at Saturation Level

$$p_{tw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 4.0 \cdot kPa$$

Soil pressure at Toe - base elevation

$$p_E := \begin{cases} p_{tw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_J) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_J) & \text{otherwise} \end{cases}$$

$$p_E = 16.04 \cdot kPa$$

Total soil loads on Wall

$$P_{soil\_t} := \begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} + p_{tw} \cdot (EL_{tw} - EL_J) \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J) \end{bmatrix} \cdot b = 20.65 \cdot kN$$

Resultant location

$$y_{soil\_t} := \begin{cases} 0 & \text{if } P_{soil\_t} = 0 \\ h_{key} - \dfrac{\begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} \cdot \left[(EL_{tw} - EL_J) + \frac{1}{3}(EL_F - EL_{tw}) \right] + p_{tw} \cdot \frac{1}{2}(EL_{tw} - EL_J)^2 \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)^2 \cdot \frac{1}{3} \end{bmatrix} \cdot b}{P_{soil\_t}} & \text{otherwise} \end{cases}$$

$$y_{soil\_t} = 0.66 \cdot m$$

Moment about Toe $M_{soil\_t} := P_{soil\_t} \cdot y_{soil\_t} = 13.62 \cdot kN \cdot m$

6.2 Lateral Soil Load on Heel Side

Soil pressure at Saturation Level

$$p_{hw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0psf & \text{otherwise} \end{cases} = 32.6 \cdot kPa$$

Soil pressure at Heel - base elevation

$$p_D := \begin{cases} p_{hw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_J) & \text{if } EL_B > EL_{hw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_J) & \text{otherwise} \end{cases}$$

$$p_D = 44.72 \cdot kPa$$

Total soil loads on Base

$$P_{soil\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} + p_{hw} \cdot (EL_{hw} - EL_J) \dots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)\right] \cdot b$$

$$P_{soil\_h} = 122.22 \cdot kN$$

Resultant location

$$y_{soil\_h} := \frac{\left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} \cdot \left[EL_{hw} - EL_J + \frac{1}{3}(EL_B - EL_{hw})\right] + p_{hw} \cdot \frac{1}{2}(EL_{hw} - EL_J)^2 \dots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{soil\_h}} - h_{key}$$

$$y_{soil\_h} = 0.17 \cdot m$$

Moment about Toe $M_{soil\_h} := P_{soil\_h} \cdot y_{soil\_h} = 20.9 \cdot kN \cdot m$

6.3 Surcharge Soil Load - Heel Side

Surcharge soil pressure $p_{sur} := k_o \cdot \gamma_{soilm} \cdot h_{sur} = 0 \cdot kPa$

Soil load on wall $P_{sur} := p_{sur} \cdot (EL_B - EL_J) \cdot b = 0 \cdot kN$

Resultant location $y_{sur} := \frac{1}{2} \cdot (EL_B - EL_J) - h_{key} = 0.88\ m$

Moment about Toe $M_{sur} := P_{sur} \cdot y_{sur} = 0 \cdot kN \cdot m$

7.0 GRAVITY LOADS

7.1 Weight of Concrete

Weight of Wall footing/base $W_{conc} := \gamma_c \cdot (t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}) \cdot b = 88.13 \cdot kN$

Resultant location
$$x_{conc} := \frac{\left[\begin{array}{l}\frac{1}{2} t_{base} \cdot L_{base}{}^2 + L_{stem} \cdot t_{stem} \cdot (L_{toe} + 0.5 t_{stem}) \ldots \\ + t_{key} \cdot h_{key} \cdot (L_{base} - 0.5 t_{key})\end{array}\right]}{t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}} = 1.64\,m$$

Moment about Toe $M_{conc} := W_{conc} \cdot x_{conc} = 144.11 \cdot kN \cdot m$

7.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{soil\_h} := b \cdot L_{heel} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{if } EL_B < EL_{hw} \\ \gamma_{soilm} \cdot (EL_B - EL_{hw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max[0, (EL_{hw} - EL_C)] & \text{otherwise} \end{array} \right.$$

$W_{soil\_h} = 110 \cdot kN$

Resultant location $x_{soil\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{soilw\_h} := W_{soil\_h} \cdot x_{soil\_h} = 247.5 \cdot kN \cdot m$

7.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_h} := \gamma_w \cdot \max[0kip, (EL_{hw} - EL_C)] \cdot L_{heel} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{w\_h} := W_{w\_h} \cdot x_{w\_h} = 0 \cdot kN \cdot m$

7.4 Weight of Soil on Toe

Weight of Soil on toe Note: Water and soil elevations MUST NOT be below footing elevation

$$W_{soil\_t} := b \cdot L_{toe} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (\max(0, EL_F - EL_C)) & \text{if } EL_F < EL_{tw} \\ \gamma_{soilm} \cdot \max(0, EL_F - EL_{tw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max(EL_{tw} - EL_C, 0) & \text{otherwise} \end{array} \right.$$

$W_{soil\_t} = 5 \cdot kN$

Resultant location $x_{soil\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

Moment about Toe $M_{soilw\_t} := W_{soil\_t} \cdot x_{soil\_t} = 1.9 \cdot kN \cdot m$

7.5 Weight of Water on Toe

Weight of Water on toe $W_{w\_t} := \gamma_w \cdot max\left[0kip, \left(EL_{tw} - EL_C\right)\right] \cdot L_{toe} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_t} := 0.5\left(x_H - x_E\right) = 0.38 \cdot m$

Moment about Toe $M_{w\_t} := W_{w\_t} \cdot x_{w\_t} = 0 \cdot kN \cdot m$

7.6 Weight of Soil under Footing and Above Failure Plane EJ

Depth of Soil Wedge Near Key $h_{s\_under} := \left(x_L - x_E\right) \cdot \frac{h_{key}}{L_{base}} = 1.29\,m$

Length of Soil Wedge $L_{s\_under} := x_L - x_E = 2.8\,m$

Weight of Soil Wedge Under Footing $W_{s\_under} := \gamma_{soilsat} \cdot \left(0.5 \cdot h_{s\_under} \cdot L_{s\_under}\right) \cdot b = 36.18 \cdot kN$

Resultant location $x_{s\_under} := \frac{2}{3}\left(x_L - x_E\right) = 1.87 \cdot m$

Moment about Toe $M_{s\_under} := W_{s\_under} \cdot x_{s\_under} = 67.5 \cdot kN \cdot m$

8.0 Overturning Stability Assessment - See Figure 2

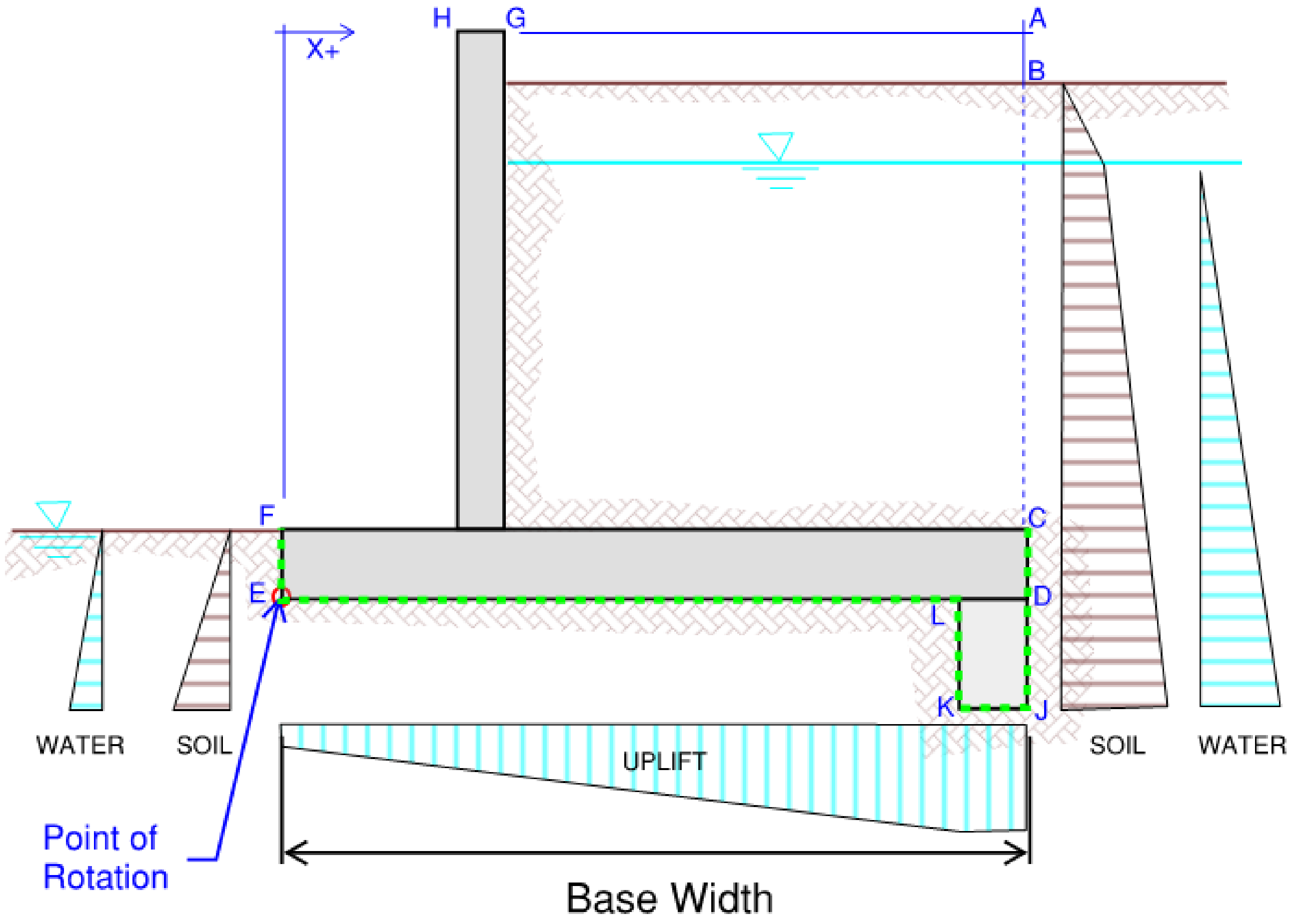

Figure 2. Free Body Diagram for Overturning Analysis

Uplift loads for Overturning

$$P_{u\_ot} := \left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]\cdot b = 43.16\cdot kN$$

Uplift resultant location

$$x_{u\_ot} := \frac{\left[\left[\frac{x_L - x_E}{2} + \frac{x_L - x_E}{6}\cdot\frac{\left(u_h - u_t\right)}{u_t + u_h}\right]\cdot\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right)\right] \ldots \\ + \left(L_{base} - 0.5t_{key}\right)\cdot\left(u_h\cdot t_{key}\right)\right]}{\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]}$$

$$x_{u\_ot} = 1.96\,m$$

Uplift Moment about Toe

$$M_{u\_ot} := P_{u\_ot}\cdot x_{u\_ot} = 84.4\cdot kN\cdot m$$

Total Vertical Forces	$\Sigma V_{ot} := W_{conc} + W_{soil\_h} + W_{soil\_t} + W_{w\_h} + W_{w\_t} - P_{u\_ot} = 160 \cdot kN$
Total Horizontal Forces	$\Sigma H_{ot} := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 101.56 \cdot kN$
Total Resisting Moments	$\Sigma M_{r\_ot} := M_{conc} + M_{soilw\_h} + M_{w\_h} + M_{soilw\_t} + M_{w\_t} = 393.5 \cdot kN \cdot m$
Total Driving Moments	$\Sigma M_{d\_ot} := M_{hw} + M_{soil\_h} + M_{sur} + M_{u\_ot} + M_{tw} + M_{soil\_t} = 118.9 \cdot kN \cdot m$
Resultant Location from Toe	$x_{r\_ot} := \frac{\Sigma M_{r\_ot} - \Sigma M_{d\_ot}}{\Sigma V_{ot}} = 1.72 \cdot m$
Normalized Resultant Location	$\frac{x_{r\_ot}}{L_{base}} = 0.528$
Eccentricity	$e_{x\_ot} := \frac{L_{base}}{2} - x_{r\_ot} = -0.09 \cdot m$
Approx. Base in Compression	$l_{comp\_ot} := \min\left[L_{base}, \frac{3}{2} \cdot \left(L_{base} - 2 \cdot e_{x\_ot}\right)\right] = 3.25 \cdot m$
Percent Base in Compression	$Base\_Comp := \left(\frac{l_{comp\_ot}}{L_{base}}\right) = 100 \cdot \%$
Resultant Location Check	$check_{res} := if\left(Base\_Comp \geq Base\_Comp_{Req}, "OK", "NG"\right) = "OK"$

9.0 Flotation Stability Assessment - See Figure 2

Calculated Flotation Safety Factor	$FS_f := \frac{W_{conc} + W_{soil\_h} + W_{soil\_t} + W_{w\_h} + W_{w\_t}}{P_{u\_ot}} = 4.7$
Flotation Stability Check	$check_{floatation} := if\left(FS_f \geq FS_{float}, "OK", "NG"\right) = "OK"$

10.0 Sliding Stability Assessment - See Figure 3

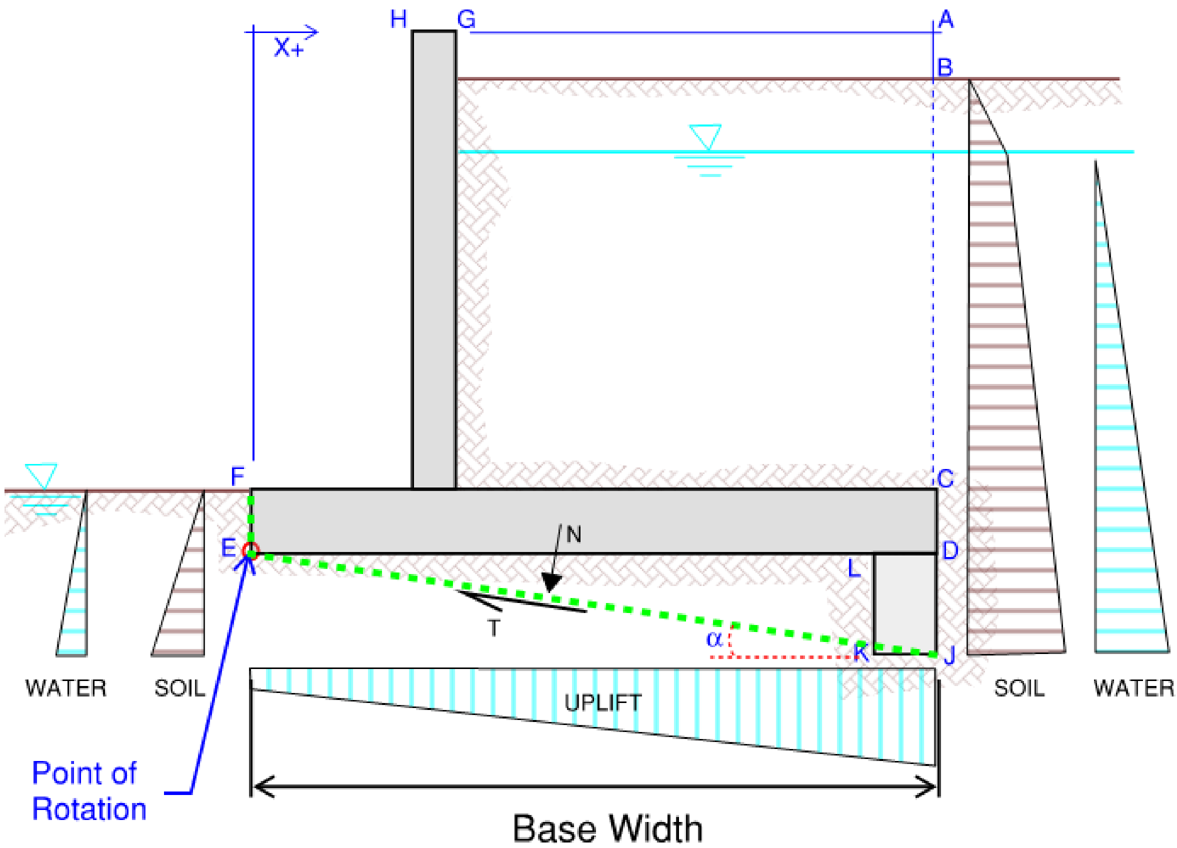

Figure 3. Free Body Diagram for Sliding Analysis

Length of Sliding Failure Plane, EJ

$$L_{fp} := \sqrt{L_{base}^2 + h_{key}^2} = 3.58\,m$$

Angle of Sliding Failure Plane From Horizontal

$$\alpha := atan\left(\frac{h_{key}}{L_{base}}\right) = 24.8 \cdot deg$$

Total Vertical Forces

$$\Sigma V := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{s\_under} + W_{w\_t} - P_u = 199.5 \cdot kN$$

Total Horizontal Forces

$$\Sigma H := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 101.56 \cdot kN$$

Total Resisting Moments

$$\Sigma M_r := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} + M_{s\_under} = 461\ m \cdot kN$$

Total Driving Moments

$$\Sigma M_d := M_{hw} + M_{soil\_h} + M_{sur} + M_u \cdots + M_{tw} + M_{soil\_t} = 112.2 \cdot kN \cdot m$$

Normal Force on Sliding Failure Plane: $N_s := \Sigma H \cdot \sin(\alpha) + \Sigma V \cdot \cos(\alpha) = 223.66 \cdot kN$

Tangential Force on Sliding Failure Plane: $T_s := \Sigma H \cdot \cos(\alpha) - \Sigma V \cdot \sin(\alpha) = 8.63 \cdot kN$

Calculated Sliding Safety Factor $FS_s := \dfrac{\left|N_s \cdot \tan(0.95\phi_{soil})\right|}{\left|T_s\right|} = 10.89$

Sliding Stability Check $check_{sliding} := if(FS_s \geq FS_{Sliding}, "OK", "NG") = "OK"$

11.0 Bearing Capacity Assessment

Resultant Location from Toe $x_r := \dfrac{\Sigma M_r - \Sigma M_d}{N_s} = 1.56 \cdot m$

Eccentricity of N_s from center of base $e_s := \dfrac{L_{fp}}{2} - x_r = 0.23 \cdot m$

Approx. Base in Compression $l_{comp.s} := \min\left[L_{fp}, \dfrac{3}{2} \cdot (L_{fp} - 2 \cdot e_s)\right] = 3.58 \cdot m$

Updated Eccentricity $e_x := \dfrac{l_{comp.s} - L_{fp}}{2} + e_s = 0.23 \cdot m$

Effective base pressure at Toe $q_t := \left(\dfrac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 + \dfrac{6 \cdot e_x}{l_{comp.s}}\right) = 86.57 \cdot kPa$

Effective base pressure at Heel $q_h := \max\left[\left(\dfrac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 - \dfrac{6 \cdot e_x}{l_{comp.s}}\right), 0\right] = 38.39 \cdot kPa$

Calculated Bearing Safety Factor $FS_b := \dfrac{Q_b}{\max(q_t, q_h)} = 1.73$

Bearing Pressure Check $check_{bearing} := if(FS_b \geq FS_{Bearing}, "OK", "NG") = "OK"$

12.0 Summary of Stability Assessments

Base Compression / Resultant Location	$Base\_Comp = 100 \cdot \%$	$check_{res} = "OK"$
Flotation Stability	$FS_f = 4.7$	$check_{floatation} = "OK"$
Sliding Stability	$FS_s = 10.9$	$check_{sliding} = "OK"$
Bearing Pressure	$FS_b = 1.7$	$check_{bearing} = "OK"$

13.0 Structural Loads

13.1 Shear and Moment at Stem Base - See Figure 4

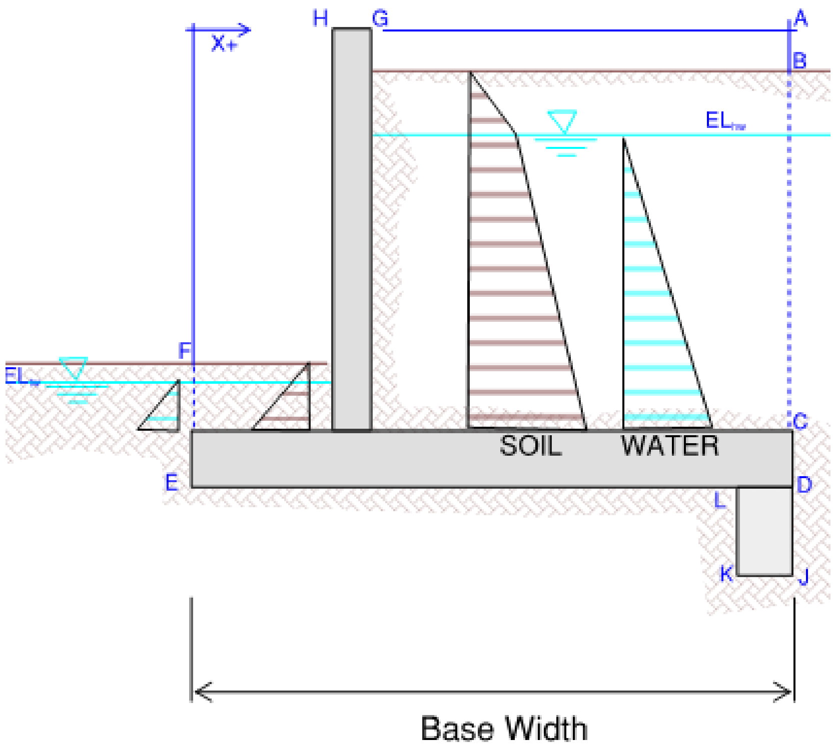

Figure 4 - Loads on Stem

13.1.1 Hydrostatic Load at Stem Base

Heel side hydrostatic load

$$P_{hw\_stem} := \frac{1}{2}\gamma_w \cdot \left(EL_{hw} - EL_C\right)^2 \cdot b = 0.0 \cdot kN$$

Heel side moment at stem base

$$M_{hw\_stem} := P_{hw\_stem} \cdot \left(\frac{EL_{hw} - EL_C}{3}\right) = 0 \cdot kN \cdot m$$

Toe side hydrostatic load

$$P_{tw\_stem} := \frac{1}{2}\gamma_w \cdot \left(EL_{tw} - EL_C\right)^2 \cdot b = 0.0 \cdot kN$$

Toe side moment at stem base

$$M_{tw\_stem} := P_{tw\_stem} \cdot \left(\frac{EL_{tw} - EL_C}{3}\right) = 0 \cdot kN \cdot m$$

13.1.2 Lateral Soil Loads at Stem Base

Soil pressure at saturation level - Toe Side

$$p_t := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 3.95 \cdot kPa$$

Soil pressure at stem base - Toe Side

$$p_{C.t} := \begin{cases} p_t + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_C) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.t} = 3.95 \cdot kPa$$

Lateral soil loads at stem base - Toe Side

$$P_{s\_t} := \left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t + p_t \cdot (EL_{tw} - EL_C) \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)\right] \cdot b = 0.66 \cdot kN$$

Resultant location

$$y_{s\_t} := \begin{cases} 0 & \text{if } P_{s\_t} = 0 \\ \dfrac{\left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t \cdot \left[(EL_{tw} - EL_C) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_t \cdot \frac{1}{2}(EL_{tw} - EL_C)^2 \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{s\_t}} & \text{otherwise} \end{cases}$$

$$y_{s\_t} = 0.11 \cdot m$$

Lateral soil moment at stem base - Toe Side

$$M_{s\_t} := P_{s\_t} \cdot y_{s\_t} = 0.07 \cdot kN \cdot m$$

Soil pressure at saturation level - Heel Side

$$p_h := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0kPa & \text{otherwise} \end{cases} = 32.63 \cdot kPa$$

Soil pressure at stem base - Heel Side

$$p_{C.h} := \begin{cases} p_h + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_C) & \text{if } EL_B > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.h} = 32.63 \cdot kPa$$

Lateral soil loads at stem base - Heel Side

$$P_{s\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_h + p_h \cdot (EL_{hw} - EL_C) \ldots + 0.5 \cdot (p_{C.h} - p_h) \cdot (EL_{hw} - EL_C)\right] \cdot b = 44.87 \cdot kN$$

Resultant location

$$y_{s\_h} := \begin{cases} 0 & \text{if } P_{s\_h} = 0 \\ \dfrac{\left[0.5\cdot(EL_B - EL_{hw})\cdot p_h\cdot\left[(EL_{hw} - EL_C) + \frac{1}{3}(EL_B - EL_{hw})\right] + p_h\cdot\frac{1}{2}(EL_{hw} - EL_C)^2 \ldots \\ + 0.5\cdot(p_{C.h} - p_h)\cdot(EL_{hw} - EL_C)^2\cdot\frac{1}{3}\right]\cdot b}{P_{s\_h}} & \text{otherwise} \end{cases}$$

$$y_{s\_h} = 0.92\cdot m$$

Lateral soil moment at stem base - Heel Side $M_{s\_h} := P_{s\_h}\cdot y_{s\_h} = 41.13\cdot kN\cdot m$

13.1.3 Surcharge Loads at Stem Base

Surcharge load at stem base $P_{sur\_stem} := p_{sur}\cdot(EL_B - EL_C)\cdot b = 0\cdot kN$

Surcharge Moment about Toe $M_{sur\_stem} := P_{sur}\cdot\frac{1}{2}(EL_B - EL_C) = 0\cdot kN\cdot m$

13.2 Shear and Moment on Heel - See Figure 5 & Figure 6

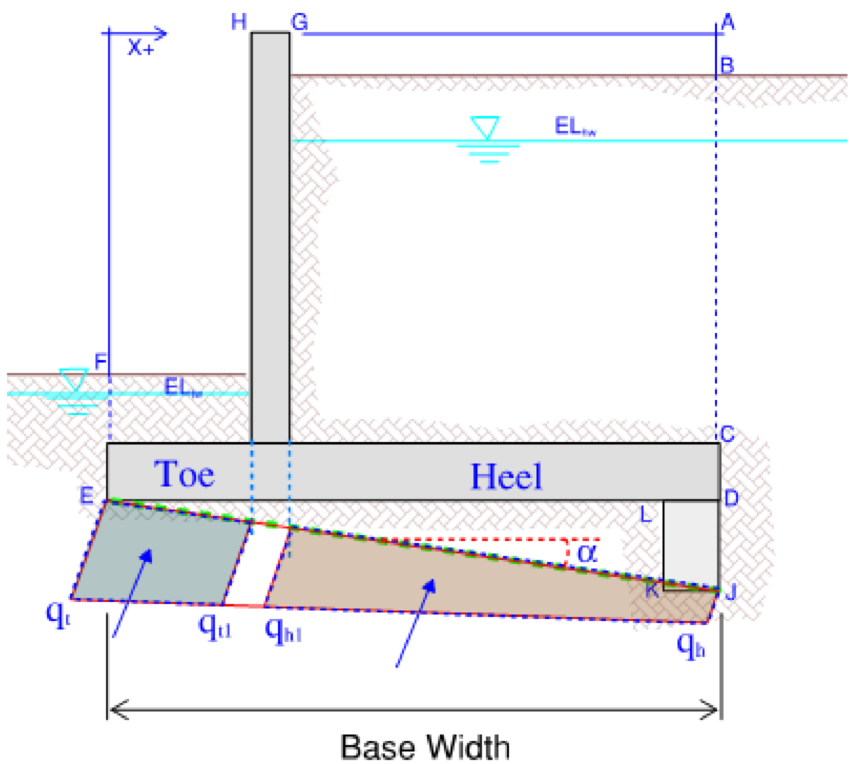

Figure 5 - Base Reaction Loads on Base (Heel & Toe)

13.2.1 Weight of Concrete Heel

Weight of Wall footing/base $W_{c\_heel} := \gamma_c \cdot (t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}) \cdot b = 39.36 \cdot kN$

Resultant location $x_{c\_heel} := \dfrac{\left[\frac{1}{2} t_{base} \cdot L_{heel}{}^2 \ldots + t_{key} \cdot h_{key} \cdot (L_{heel} - 0.5 t_{key})\right]}{t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}} = 1.31\,m$

Moment about stem base $M_{c\_heel} := W_{c\_heel} \cdot x_{c\_heel} = 51.66 \cdot kN \cdot m$

13.2.2 Weight of Soil on Heel

Weight of Soil on heel $W_{s\_heel} := W_{soil\_h} = 110 \cdot kN$

Moment about stem base $M_{s\_heel} := W_{s\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 110 \cdot kN \cdot m$

13.2.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_heel} := W_{w\_h} = 0 \cdot kN$

Moment about stem base $M_{w\_heel} := W_{w\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 0 \cdot kN \cdot m$

13.2.4 Weight of Concrete Toe

Weight of Wall footing/base $W_{c\_toe} := \gamma_c \cdot t_{base} \cdot L_{toe} \cdot b = 8.81 \cdot kN$

Moment about stem base $M_{c\_toe} := W_{c\_toe} \cdot \left(\frac{1}{2} \cdot L_{toe}\right) = 3.3 \cdot kN \cdot m$

13.2.5 Weight of Soil on Toe

Weight of Soil on Toe $W_{s\_toe} := W_{soil\_t} = 5 \cdot kN$

Moment about stem base $M_{s\_toe} := W_{s\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 1.9 \cdot kN \cdot m$

13.2.6 Weight of Water on Toe

Weight of Water on Toe $W_{w\_toe} := W_{w\_t} = 0 \cdot kN$

Moment about stem base $M_{w\_toe} := W_{w\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 0 \cdot kN \cdot m$

13.2.7 Bearing Pressures on Footing

Approx. Base in Compression $l_{comp.s} = 3.58\,m$

Effective base pressure at Toe $q_t = 86.57 \cdot kPa$

Effective base pressure at Heel $q_h = 38.39 \cdot kPa$

Compression length under Toe $L_{bearing\_t} := \dfrac{L_{toe}}{\cos(\alpha)} = 0.83\,m$

Compression length under Heel $L_{bearing\_h} := l_{comp.s} - \dfrac{(x_G - x_E)}{\cos(\alpha)} = 2.2\,m$

Bearing pressure under toe side of stem $q_{t1} := L_{bearing\_t} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 75.45 \cdot kPa$

Bearing pressure under heel side of stem $q_{h1} := \dfrac{(x_G - x_E)}{\cos(\alpha)} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 68.04 \cdot kPa$

13.2.8 Soil Reaction on Heel

Soil reaction load on Heel $P_{bearing\_h} := \dfrac{1}{2} \cdot (q_h + q_{h1}) \cdot L_{bearing\_h} \cdot b = 117.22 \cdot kN$

Resultant location $x_{bearing\_h} := \dfrac{L_{bearing\_h}}{2} + \dfrac{L_{bearing\_h}}{6} \cdot \dfrac{(q_h - q_{h1})}{q_{h1} + q_h} = 1\,m$

Vertical Component $P_{h\_v} := P_{bearing\_h} \cdot \cos(\alpha) = 106.43 \cdot kN$

Horizontal Component $P_{h\_h} := P_{bearing\_h} \cdot \sin(\alpha) = 49.12 \cdot kN$

Horizontal Moment Arm $x_{h\_h} := x_{bearing\_h} \cdot \cos(\alpha) = 0.91\,m$

Vertical Moment Arm $y_{h\_v} := \left[\dfrac{(x_G - x_E)}{\cos(\alpha)} + x_{bearing\_h}\right] \cdot \sin(\alpha) = 1\,m$

Moment on Heel $M_{bearing\_h} := P_{h\_v} \cdot x_{h\_h} + P_{h\_h} \cdot y_{h\_v} = 145.46 \cdot kN \cdot m$

13.2.9 Soil Reaction on Toe

Soil reaction load on Toe $P_{bearing\_t} := \frac{1}{2} \cdot (q_t + q_{t1}) \cdot L_{bearing\_t} \cdot b = 66.92 \cdot kN$

Resultant location $x_{bearing\_t} := \frac{L_{bearing\_t}}{2} + \frac{L_{bearing\_t}}{6} \cdot \frac{(q_t - q_{t1})}{q_t + q_{t1}} = 0.42\ m$

Vertical Component $P_{t\_v} := P_{bearing\_t} \cdot \cos(\alpha) = 60.76 \cdot kN$

Horizontal Component $P_{t\_h} := P_{bearing\_t} \cdot \sin(\alpha) = 28.04 \cdot kN$

Horizontal Moment Arm $x_{t\_h} := x_{bearing\_t} \cdot \cos(\alpha) = 0.38\ m$

Vertical Moment Arm $y_{t\_v} := (L_{bearing\_t} - x_{bearing\_t}) \cdot \sin(\alpha) = 0.17\ m$

Moment on Toe $M_{bearing\_t} := P_{t\_v} \cdot x_{t\_h} + P_{t\_h} \cdot y_{t\_v} = 28.05 \cdot kN \cdot m$

13.2.10 Uplift Pressure on Footing - Figure 6

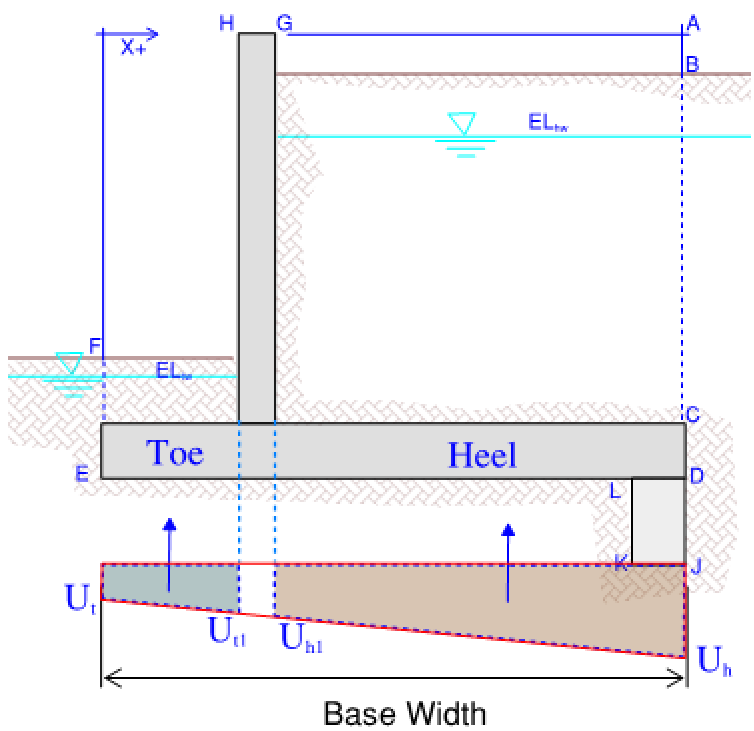

Figure 6 - Uplift Loads on Base (Heel & Toe)

Uplift pressure under toe side of stem $u_{t1} := L_{toe} \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 8.3 \cdot kPa$

Uplift pressure under heel side of stem $u_{h1} := (x_G - x_E) \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 10.56 \cdot kPa$

13.2.11 Uplift Loads Heel

Uplift load on Heel $P_{u\_h} := \frac{1}{2} \cdot (u_h + u_{h1}) \cdot L_{heel} \cdot b = 30.18 \cdot kN$

Moment Arm $x_{u\_h} := \frac{L_{heel}}{2} + \frac{L_{heel}}{6} \cdot \frac{(u_h - u_{h1})}{u_{h1} + u_h} = 1.1\,m$

Moment on Heel $M_{u\_h} := P_{u\_h} \cdot x_{u\_h} = 33.2 \cdot kN \cdot m$

13.2.12 Uplift Loads Toe

Uplift load on Toe $P_{u\_t} := \frac{1}{2} \cdot (u_t + u_{t1}) \cdot L_{toe} \cdot b = 4.95 \cdot kN$

Moment Arm $x_{u\_t} := \frac{L_{toe}}{2} + \frac{L_{toe}}{6} \cdot \frac{(u_t - u_{t1})}{u_{t1} + u_t} = 0.34\,m$

Moment on Toe $M_{u\_t} := P_{u\_t} \cdot x_{u\_t} = 1.7 \cdot kN \cdot m$

13.3 Structural Load Summary

Net shear at stem base $V_{stem} := P_{hw\_stem} - P_{tw\_stem} + P_{s\_h} - P_{s\_t} + P_{sur\_stem} = 44.2 \cdot kN$

Net moment at stem base $M_{stem} := M_{hw\_stem} - M_{tw\_stem} + M_{s\_h} - M_{s\_t} + M_{sur\_stem} = 41.1 \cdot kN \cdot m$

Net shear on Toe $V_t := W_{c\_toe} + W_{s\_toe} + W_{w\_toe} - P_{t\_v} - P_{u\_t} = -51.9 \cdot kN$

Net moment on Toe $M_t := M_{c\_toe} + M_{s\_toe} + M_{w\_toe} - M_{bearing\_t} - M_{u\_t} = -24.6 \cdot kN \cdot m$

Net shear on Heel $V_h := W_{c\_heel} + W_{s\_heel} + W_{w\_heel} - P_{h\_v} - P_{u\_h} = 12.7 \cdot kN$

Net moment on Heel $M_h := M_{c\_heel} + M_{s\_heel} + M_{w\_heel} - M_{bearing\_h} - M_{u\_h} = -17 \cdot kN \cdot m$

13.4 Controlling Structural Loads (Unfactored)

Stem cross section

$M_{stem} = 41.1 \cdot kN \cdot m$

$V_{stem} = 44.2 \cdot kN$

Toe cross section

$M_{toe} := M_t = -24.57 \cdot kN \cdot m$

$V_{toe} := V_t = -51.9 \cdot kN$

Heel cross section

$M_{heel} := \min\left(\max\left(M_{stem} - \left|M_{toe}\right|, M_h\right), M_{stem}\right) = 16.5 \cdot kN \cdot m$

$V_{heel} := \max\left(V_{stem}, V_h\right) = 44.2 \cdot kN$

STABILITY ANALYSIS FOR CANTILEVER WALL WITH KEY

Project / Client: Springbank Off-Stream Storage (SR1) / Alberta Transportation

Section Location: Intake Structure Wing Wall - Closest to Intake Structure

1.0 OBJECTIVE

For a particular load condition, analyze a reinforced concrete cantilever wall with shear key for overturning, sliding, flotation, and bearing capacity in accordance with criteria described in the listed references.

2.0 BACKGROUND INFORMATION

2.1 DATA SOURCES

1- Soils Report - Recommended Geotechnical Soil Parameters, SR-1 Low Level Outlet (LLO) Structures. July 19, 2019

2- Drawings - Design Drawings

3- Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM) , 2019

2.2 REFERENCES

1. (CDA) Dam Safety Guidelines, 2007 (revised 2013).
2. "Water Control Structures Selected Design Guidelines," Alberta Transportation & Alberta Environment, Calgary Alberta, November 2004.

3.0 DESIGN PARAMETERS AND CRITERIA

3.1 Stability Analysis Criteria (Data source 2)

Load Case	$LC := 2$
Load Case Description	$\text{vlookup}(LC, CASES, 1)_0 = \text{"Construction"}$
Sliding Minimum Factor of Safety	$FS_{Sliding} := \text{vlookup}(LC, CASES, 2)_0 = 1.3$
Overturning Criteria	$Base\_Comp_{Req} := \text{vlookup}(LC, CASES, 3)_0 = 100 \cdot \%$
Bearing Capacity Minimum Factor of Safety	$FS_{Bearing} := \text{vlookup}(LC, CASES, 4)_0 = 1$
Flotation Minimum Factor of Safety	$FS_{float} := \text{vlookup}(LC, CASES, 5)_0 = 1.3$

3.2 Material Properties - Data Source 1 Unless Otherwise Noted

Unit Weight of Water	$\gamma_w := 9.81 \frac{kN}{m^3}$	
Unit Weight of Concrete	$\gamma_c := 23.5 \cdot \frac{kN}{m^3}$	Data Source 3
Unit Weight of Soil (Moist)	$\gamma_{soilm} := 20 \frac{kN}{m^3}$	
Soil Unit Weight Beneath Base (Saturated)	$\gamma_{soilsat} := 20 \frac{kN}{m^3}$	
Soil Cohesion - Drained	$c_{soil} := 0kPa$	
Soil Angle of Internal Friction - Drained	$\phi_{soil} := 24deg$	
Soil Ultimate Bearing Pressure	$Q_b := 150kPa$	
Slope of backfill (Conservative)	$\beta := 0$	
At-rest lateral earth pressure coefficient	$k_o := 1 - \sin(\phi_{soil}) = 0.59$	

<u>4.0 WALL SECTION DESCRIPTION</u>

4.1 Point Locations (Refer to Figure 1 and Drawings)

A - Top of wall	$EL_A := 1189.9m$	$x_A := 3.25m$
B - Top of fill - reservoir side	$EL_B := 1189.75m$	$x_B := x_A = 3.25 \cdot m$
C - Top of Heel	$EL_C := 1187m$	$x_C := x_A = 3.25 \cdot m$
D - Heel side end of footing	$EL_D := EL_C - 500mm = 1186.50\ m$	$x_D := x_A = 3.25 \cdot m$
E - Toe side end of footing	$EL_E := EL_D = 1186.50 \cdot m$	$x_E := 0m$
F - Top of Fill - land side	$EL_F := EL_C + 0.333m = 1187.33 \cdot m$	$x_F := x_E = 0$
G - Heel side face of wall stem	$EL_G := EL_A = 1189.90 \cdot m$	$x_G := 1.25m$
H - Toe side face of wall stem	$EL_H := EL_A = 1189.90 \cdot m$	$x_H := x_G - 0.500m = 0.75 \cdot m$

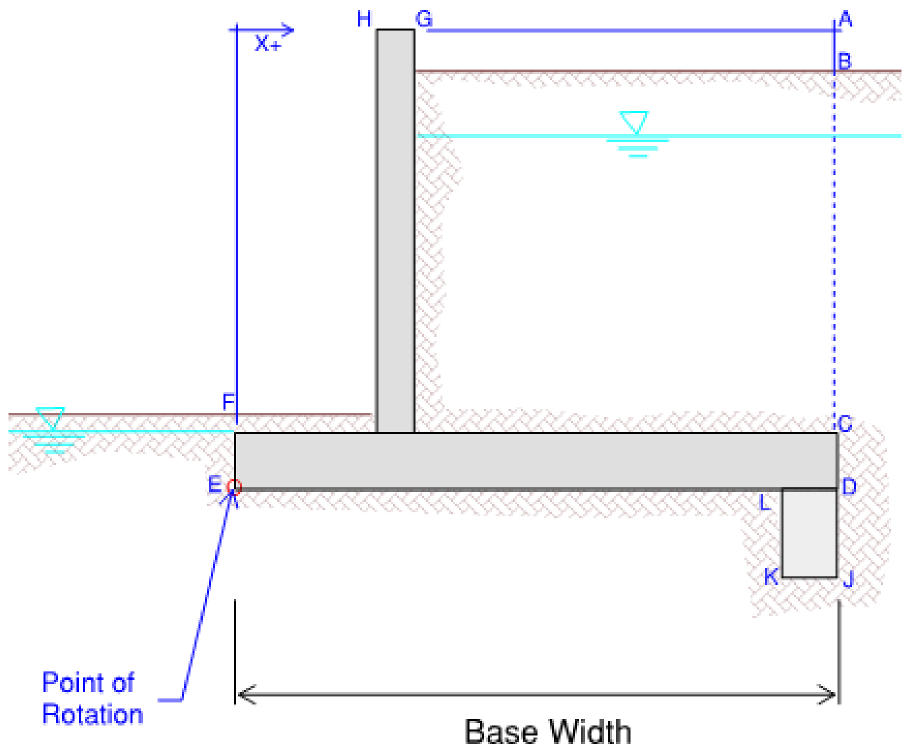

Figure 1. Cantilever Wall Section

J - Bottom of key - heel side	$EL_J := EL_C - 2m = 1185.00 \cdot m$	$x_J := x_D = 3.25\,m$
K - Bottom of key - toe side	$EL_K := EL_J = 1185.00 \cdot m$	$x_K := x_J - 450mm = 2.8 \cdot m$
L - Top of key	$EL_L := EL_D = 1186.50 \cdot m$	$x_L := x_K = 2.8\,m$

Applied Loads Data Source 2

Heel side water elevation

$$EL_{hw} := \begin{array}{|l} EL_B \ \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 1)_0 \cdot 1m\right) \ \text{otherwise} \end{array} = 1187$$

Toe side water elevation

$$EL_{tw} := \begin{array}{|l} EL_F \ \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 2)_0 \cdot 1m\right) \ \text{otherwise} \end{array} = 1187$$

Equivalent soil surcharge:

$$h_{sur} := \begin{array}{|l} 1.0m \ \text{if } LC = 2 \\ 0 \ \text{otherwise} \end{array} = 1 \cdot m$$

4.2 Additional Analysis Dimensions

Analysis Width $b := 1m$

Length of base $L_{base} := x_D - x_E = 3.25 \cdot m$

Thickness of base $t_{base} := EL_C - EL_D = 500 \cdot mm$

Length of stem $L_{stem} := EL_A - EL_C = 2.9 \cdot m$

Thickness of stem $t_{stem} := x_G - x_H = 500 \cdot mm$

Length of Heel $L_{heel} := x_A - x_G = 2000 \cdot mm$

Length of Toe $L_{toe} := x_H - x_F = 750 \cdot mm$

Thickness of Key $t_{key} := x_J - x_K = 450 \cdot mm$

Height of Key $h_{key} := EL_D - EL_J = 1500 \cdot mm$

5.0 UPLIFT & HYDROSTATIC LOADS

5.1 Uplift Pressures for Stability Analyses

Determine water pressures for designated coordinates using full headwater uplift pressure at the heel and full tailwater uplift pressure at the toe. Uplift distribution is assumed linear from heel to toe.

Hydrostatic pressure at Heel $u_h := \gamma_w \cdot (EL_{hw} - EL_J) = 20 \cdot kPa$

Hydrostatic pressure at Toe $u_t := \gamma_w \cdot (EL_{tw} - EL_E) = 5 \cdot kPa$

Total uplift loads on base $P_u := \frac{(u_h + u_t)}{2} \cdot L_{base} \cdot b = 39.85 \cdot kN$

Uplift resultant location $x_u := \frac{L_{base}}{2} + \frac{L_{base}}{6} \cdot \frac{(u_h - u_t)}{u_t + u_h} = 1.95 \cdot m$

Uplift Moment about Toe $M_u := P_u \cdot x_u = 77.7 \cdot kN \cdot m$

5.2 Headwater Hydrostatic Load - Heel Side

Headwater hydrostatic load $P_{hw} := \frac{1}{2} u_h \cdot (EL_{hw} - EL_J) \cdot b = 19.6 \cdot kN$

Headwater moment arm $y_{hw} := \frac{1}{3}(EL_{hw} - EL_J) - h_{key} = -0.83 \cdot m$

Headwater Moment about Toe $M_{hw} := P_{hw} \cdot y_{hw} = -16.4 \cdot kN \cdot m$

5.3 Tailwater Hydrostatic Load - Toe Side

Tailwater hydrostatic load $P_{tw} := \frac{1}{2} \gamma_w \cdot (EL_{tw} - EL_K)^2 \cdot b = 19.62 \cdot kN$

Tailwater moment arm $y_{tw} := h_{key} - \frac{1}{3}(EL_{tw} - EL_K) = 0.83 \cdot m$

Tailwater Moment about Toe $M_{tw} := P_{tw} \cdot y_{tw} = 16.35 \cdot kN \cdot m$

6.0 LATERAL EARTH PRESSURE

6.1 Lateral Soil Load on Toe Side

Soil pressure at Saturation Level

$$p_{tw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 4.0 \cdot kPa$$

Soil pressure at Toe - base elevation

$$p_E := \begin{cases} p_{tw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_J) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_J) & \text{otherwise} \end{cases}$$

$p_E = 16.04 \cdot kPa$

Total soil loads on Wall

$$P_{soil\_t} := \begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} + p_{tw} \cdot (EL_{tw} - EL_J) \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J) \end{bmatrix} \cdot b = 20.65 \cdot kN$$

Resultant location

$$y_{soil\_t} := \begin{cases} 0 & \text{if } P_{soil\_t} = 0 \\ h_{key} - \dfrac{\begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} \cdot \left[(EL_{tw} - EL_J) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_{tw} \cdot \frac{1}{2}(EL_{tw} - EL_J)^2 \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)^2 \cdot \frac{1}{3} \end{bmatrix} \cdot b}{P_{soil\_t}} & \text{otherwise} \end{cases}$$

$y_{soil\_t} = 0.66 \cdot m$

Moment about Toe $M_{soil\_t} := P_{soil\_t} \cdot y_{soil\_t} = 13.62 \cdot kN \cdot m$

6.2 Lateral Soil Load on Heel Side

Soil pressure at Saturation Level

$$p_{hw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0psf & \text{otherwise} \end{cases} = 32.6 \cdot kPa$$

Soil pressure at Heel - base elevation

$$p_D := \begin{cases} p_{hw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_J) & \text{if } EL_B > EL_{hw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_J) & \text{otherwise} \end{cases}$$

$$p_D = 44.72 \cdot kPa$$

Total soil loads on Base

$$P_{soil\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} + p_{hw} \cdot (EL_{hw} - EL_J) \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J) \right] \cdot b$$

$$P_{soil\_h} = 122.22 \cdot kN$$

Resultant location

$$y_{soil\_h} := \frac{\left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} \cdot \left[EL_{hw} - EL_J + \frac{1}{3} (EL_B - EL_{hw}) \right] + p_{hw} \cdot \frac{1}{2} (EL_{hw} - EL_J)^2 \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)^2 \cdot \frac{1}{3} \right] \cdot b}{P_{soil\_h}} - h_{key}$$

$$y_{soil\_h} = 0.17 \cdot m$$

Moment about Toe $M_{soil\_h} := P_{soil\_h} \cdot y_{soil\_h} = 20.9 \cdot kN \cdot m$

6.3 Surcharge Soil Load - Heel Side

Surcharge soil pressure $p_{sur} := k_o \cdot \gamma_{soilm} \cdot h_{sur} = 12 \cdot kPa$

Soil load on wall $P_{sur} := p_{sur} \cdot (EL_B - EL_J) \cdot b = 56.36 \cdot kN$

Resultant location $y_{sur} := \frac{1}{2} \cdot (EL_B - EL_J) - h_{key} = 0.88\,m$

Moment about Toe $M_{sur} := P_{sur} \cdot y_{sur} = 49.32 \cdot kN \cdot m$

7.0 GRAVITY LOADS

7.1 Weight of Concrete

Weight of Wall footing/base $W_{conc} := \gamma_c \cdot (t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}) \cdot b = 88.13 \cdot kN$

Resultant location
$$x_{conc} := \frac{\left[\frac{1}{2} t_{base} \cdot L_{base}^2 + L_{stem} \cdot t_{stem} \cdot (L_{toe} + 0.5 t_{stem}) \dots + t_{key} \cdot h_{key} \cdot (L_{base} - 0.5 t_{key})\right]}{t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}} = 1.64\,m$$

Moment about Toe $M_{conc} := W_{conc} \cdot x_{conc} = 144.11 \cdot kN \cdot m$

7.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{soil\_h} := b \cdot L_{heel} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{if } EL_B < EL_{hw} \\ \gamma_{soilm} \cdot (EL_B - EL_{hw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max[0, (EL_{hw} - EL_C)] & \text{otherwise} \end{array} \right.$$

$W_{soil\_h} = 110 \cdot kN$

Resultant location $x_{soil\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{soilw\_h} := W_{soil\_h} \cdot x_{soil\_h} = 247.5 \cdot kN \cdot m$

7.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_h} := \gamma_w \cdot \max[0kip, (EL_{hw} - EL_C)] \cdot L_{heel} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{w\_h} := W_{w\_h} \cdot x_{w\_h} = 0 \cdot kN \cdot m$

7.4 Weight of Soil on Toe

Weight of Soil on toe Note: Water and soil elevations MUST NOT be below footing elevation

$$W_{soil\_t} := b \cdot L_{toe} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (\max(0, EL_F - EL_C)) & \text{if } EL_F < EL_{tw} \\ \gamma_{soilm} \cdot \max(0, EL_F - EL_{tw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max(EL_{tw} - EL_C, 0) & \text{otherwise} \end{array} \right.$$

$W_{soil\_t} = 5 \cdot kN$

Resultant location $x_{soil\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

Moment about Toe $M_{soilw\_t} := W_{soil\_t} \cdot x_{soil\_t} = 1.9 \cdot kN \cdot m$

7.5 Weight of Water on Toe

Weight of Water on toe $W_{w\_t} := \gamma_w \cdot \max\left[0kip, \left(EL_{tw} - EL_C\right)\right] \cdot L_{toe} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_t} := 0.5\left(x_H - x_E\right) = 0.38 \cdot m$

Moment about Toe $M_{w\_t} := W_{w\_t} \cdot x_{w\_t} = 0 \cdot kN \cdot m$

7.6 Weight of Soil under Footing and Above Failure Plane EJ

Depth of Soil Wedge Near Key $h_{s\_under} := \left(x_L - x_E\right) \cdot \dfrac{h_{key}}{L_{base}} = 1.29\,m$

Length of Soil Wedge $L_{s\_under} := x_L - x_E = 2.8\,m$

Weight of Soil Wedge Under Footing $W_{s\_under} := \gamma_{soilsat} \cdot \left(0.5 \cdot h_{s\_under} \cdot L_{s\_under}\right) \cdot b = 36.18 \cdot kN$

Resultant location $x_{s\_under} := \dfrac{2}{3}\left(x_L - x_E\right) = 1.87 \cdot m$

Moment about Toe $M_{s\_under} := W_{s\_under} \cdot x_{s\_under} = 67.5 \cdot kN \cdot m$

8.0 Overturning Stability Assessment - See Figure 2

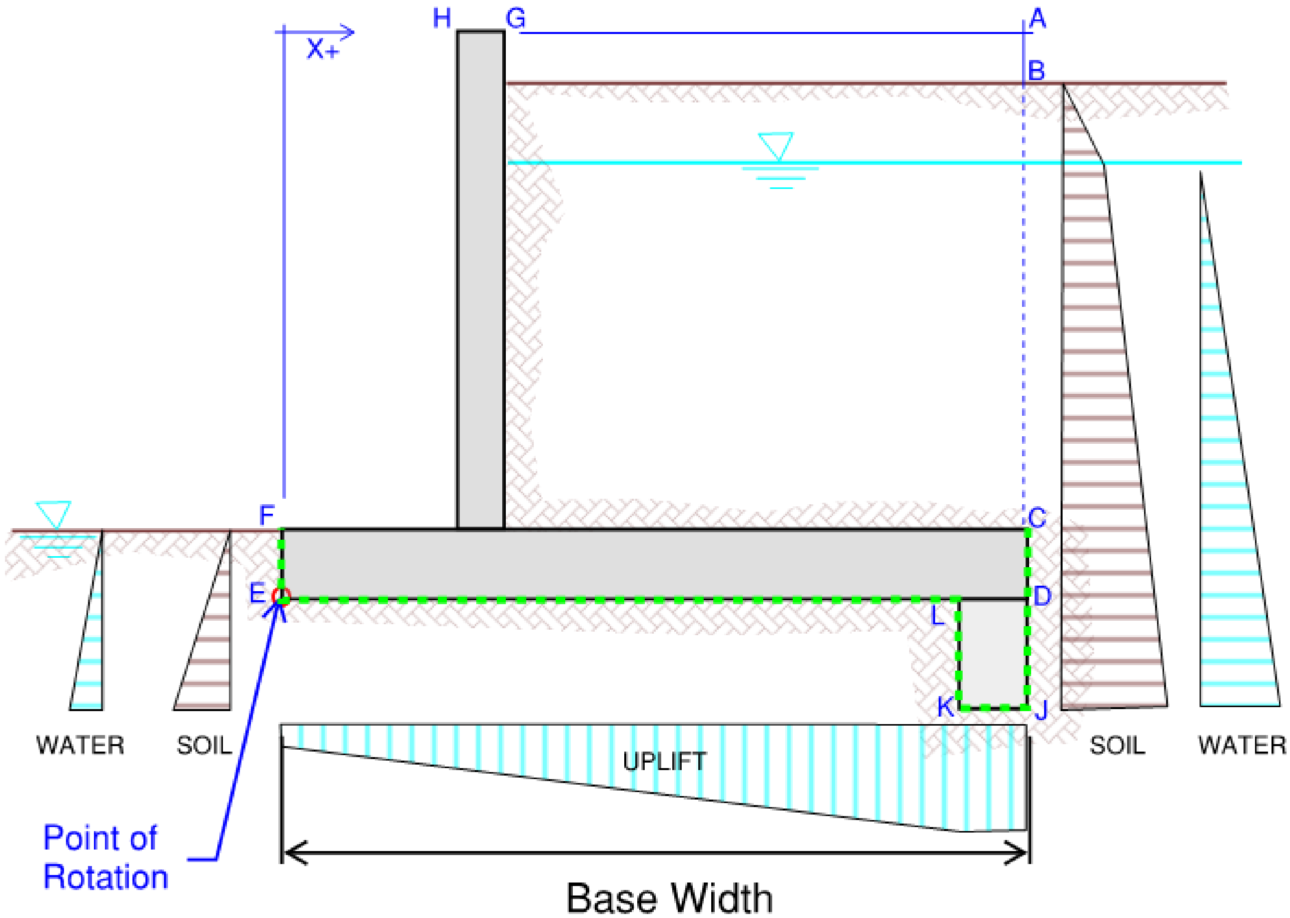

Figure 2. Free Body Diagram for Overturning Analysis

Uplift loads for Overturning

$$P_{u\_ot} := \left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]\cdot b = 43.16\cdot kN$$

Uplift resultant location

$$x_{u\_ot} := \frac{\left[\left[\frac{x_L - x_E}{2} + \frac{x_L - x_E}{6}\cdot\frac{\left(u_h - u_t\right)}{u_t + u_h}\right]\cdot\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right)\right] \ldots \\ + \left(L_{base} - 0.5t_{key}\right)\cdot\left(u_h\cdot t_{key}\right)\right]}{\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]}$$

$$x_{u\_ot} = 1.96\,m$$

Uplift Moment about Toe

$$M_{u\_ot} := P_{u\_ot}\cdot x_{u\_ot} = 84.4\cdot kN\cdot m$$

Total Vertical Forces

$$\Sigma V_{ot} := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t} - P_{u\_ot} = 160 \cdot kN$$

Total Horizontal Forces

$$\Sigma H_{ot} := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 157.92 \cdot kN$$

Total Resisting Moments

$$\Sigma M_{r\_ot} := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} = 393.5 \cdot kN \cdot m$$

Total Driving Moments

$$\Sigma M_{d\_ot} := M_{hw} + M_{soil\_h} + M_{sur} + M_{u\_ot} \cdots + M_{tw} + M_{soil\_t} = 168.2 \cdot kN \cdot m$$

Resultant Location from Toe

$$x_{r\_ot} := \frac{\Sigma M_{r\_ot} - \Sigma M_{d\_ot}}{\Sigma V_{ot}} = 1.41 \cdot m$$

Normalized Resultant Location

$$\frac{x_{r\_ot}}{L_{base}} = 0.433$$

Eccentricity

$$e_{x\_ot} := \frac{L_{base}}{2} - x_{r\_ot} = 0.22 \cdot m$$

Approx. Base in Compression

$$l_{comp\_ot} := \min\left[L_{base}, \frac{3}{2} \cdot \left(L_{base} - 2 \cdot e_{x\_ot}\right)\right] = 3.25 \cdot m$$

Percent Base in Compression

$$Base\_Comp := \left(\frac{l_{comp\_ot}}{L_{base}}\right) = 100 \cdot \%$$

Resultant Location Check

$$check_{res} := \text{if}\left(Base\_Comp \ge Base\_Comp_{Req}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$$

9.0 Flotation Stability Assessment - See Figure 2

Calculated Flotation Safety Factor

$$FS_f := \frac{W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}}{P_{u\_ot}} = 4.7$$

Flotation Stability Check

$$check_{floatation} := \text{if}\left(FS_f \ge FS_{float}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$$

10.0 Sliding Stability Assessment - See Figure 3

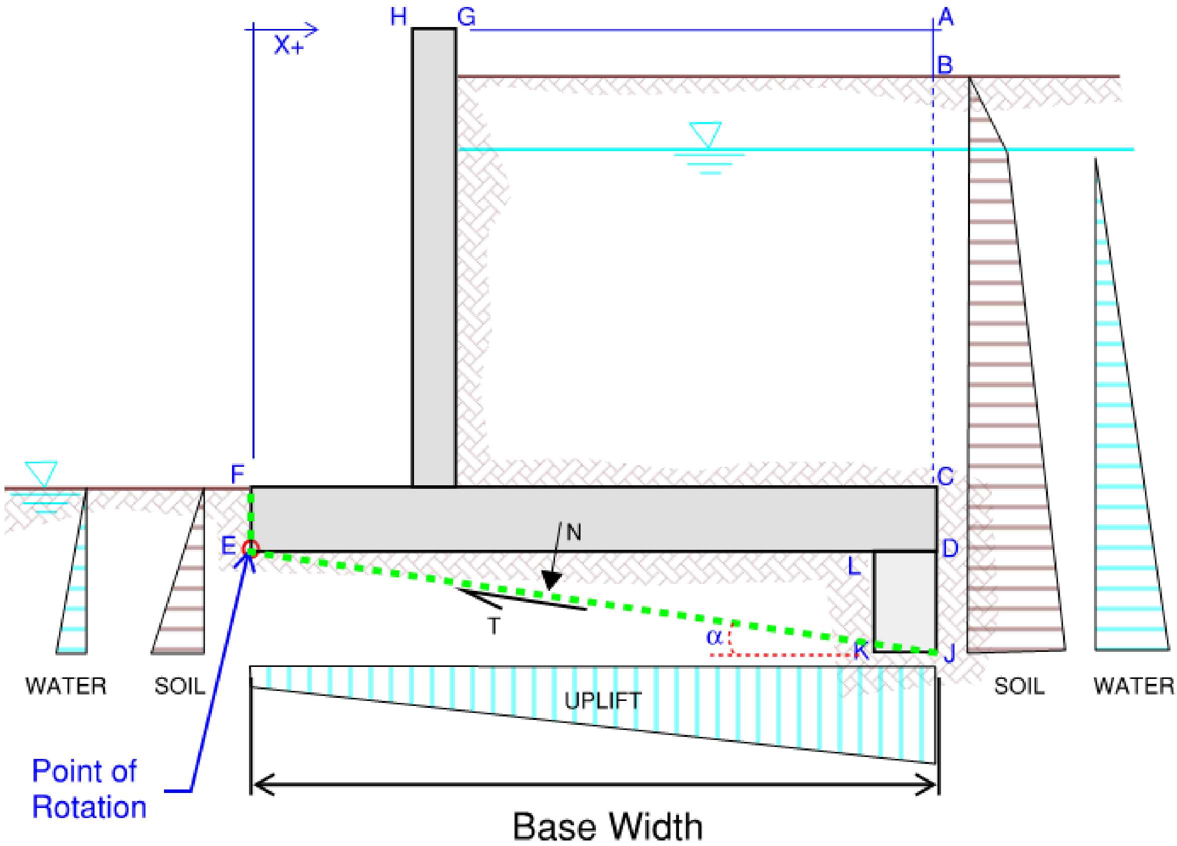

Figure 3. Free Body Diagram for Sliding Analysis

Length of Sliding Failure Plane, EJ

$$L_{fp} := \sqrt{L_{base}^{\ 2} + h_{key}^{\ 2}} = 3.58\ m$$

Angle of Sliding Failure Plane From Horizontal

$$\alpha := \operatorname{atan}\left(\frac{h_{key}}{L_{base}}\right) = 24.8 \cdot deg$$

Total Vertical Forces

$$\Sigma V := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{s\_under} + W_{w\_t} - P_u = 199.5 \cdot kN$$

Total Horizontal Forces

$$\Sigma H := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 157.92 \cdot kN$$

Total Resisting Moments

$$\Sigma M_r := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} + M_{s\_under} = 461\ m \cdot kN$$

Total Driving Moments

$$\Sigma M_d := M_{hw} + M_{soil\_h} + M_{sur} + M_u \cdots + M_{tw} + M_{soil\_t} = 161.5 \cdot kN \cdot m$$

Normal Force on Sliding Failure Plane: $N_s := \Sigma H \cdot \sin(\alpha) + \Sigma V \cdot \cos(\alpha) = 247.27 \cdot kN$

Tangential Force on Sliding Failure Plane: $T_s := \Sigma H \cdot \cos(\alpha) - \Sigma V \cdot \sin(\alpha) = 59.81 \cdot kN$

Calculated Sliding Safety Factor $$FS_s := \frac{\left|N_s \cdot \tan\left(0.95\phi_{soil}\right)\right|}{\left|T_s\right|} = 1.74$$

Sliding Stability Check $check_{sliding} := if\left(FS_s \ge FS_{Sliding}, "OK", "NG"\right) = "OK"$

11.0 Bearing Capacity Assessment

Resultant Location from Toe $$x_r := \frac{\Sigma M_r - \Sigma M_d}{N_s} = 1.21 \cdot m$$

Eccentricity of N_s from center of base $$e_s := \frac{L_{fp}}{2} - x_r = 0.58 \cdot m$$

Approx. Base in Compression $$l_{comp.s} := \min\left[L_{fp}, \frac{3}{2} \cdot \left(L_{fp} - 2 \cdot e_s\right)\right] = 3.58 \cdot m$$

Updated Eccentricity $$e_x := \frac{l_{comp.s} - L_{fp}}{2} + e_s = 0.58 \cdot m$$

Effective base pressure at Toe $$q_t := \left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 + \frac{6 \cdot e_x}{l_{comp.s}}\right) = 136.06 \cdot kPa$$

Effective base pressure at Heel $$q_h := \max\left[\left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 - \frac{6 \cdot e_x}{l_{comp.s}}\right), 0\right] = 2.10 \cdot kPa$$

Calculated Bearing Safety Factor $$FS_b := \frac{Q_b}{\max\left(q_t, q_h\right)} = 1.10$$

Bearing Pressure Check $check_{bearing} := if\left(FS_b \ge FS_{Bearing}, "OK", "NG"\right) = "OK"$

12.0 Summary of Stability Assessments

Base Compression / Resultant Location	$Base\_Comp = 100 \cdot \%$	$check_{res} = "OK"$
Flotation Stability	$FS_f = 4.7$	$check_{floatation} = "OK"$
Sliding Stability	$FS_s = 1.7$	$check_{sliding} = "OK"$
Bearing Pressure	$FS_b = 1.1$	$check_{bearing} = "OK"$

13.0 Structural Loads

13.1 Shear and Moment at Stem Base - See Figure 4

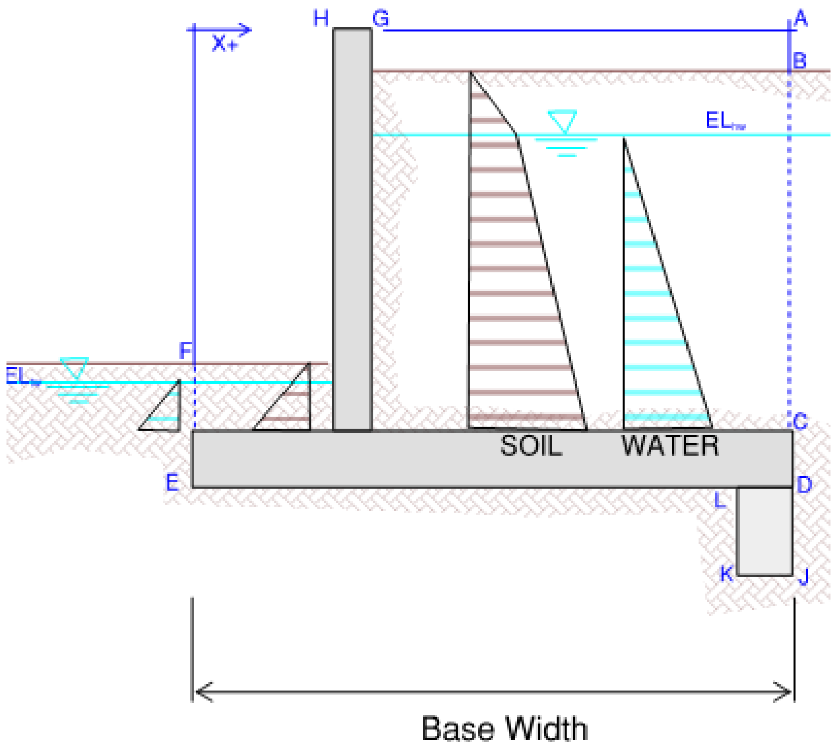

Figure 4 - Loads on Stem

13.1.1 Hydrostatic Load at Stem Base

Heel side hydrostatic load $P_{hw\_stem} := \frac{1}{2}\gamma_w \cdot (EL_{hw} - EL_C)^2 \cdot b = 0.0 \cdot kN$

Heel side moment at stem base $M_{hw\_stem} := P_{hw\_stem} \cdot \left(\frac{EL_{hw} - EL_C}{3}\right) = 0 \cdot kN \cdot m$

Toe side hydrostatic load $P_{tw\_stem} := \frac{1}{2}\gamma_w \cdot (EL_{tw} - EL_C)^2 \cdot b = 0.0 \cdot kN$

Toe side moment at stem base $M_{tw\_stem} := P_{tw\_stem} \cdot \left(\frac{EL_{tw} - EL_C}{3}\right) = 0 \cdot kN \cdot m$

13.1.2 Lateral Soil Loads at Stem Base

Soil pressure at saturation level - Toe Side

$$p_t := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 3.95 \cdot kPa$$

Soil pressure at stem base - Toe Side

$$p_{C.t} := \begin{cases} p_t + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_C) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.t} = 3.95 \cdot kPa$$

Lateral soil loads at stem base - Toe Side

$$P_{s\_t} := \left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t + p_t \cdot (EL_{tw} - EL_C) \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)\right] \cdot b = 0.66 \cdot kN$$

Resultant location

$$y_{s\_t} := \begin{cases} 0 & \text{if } P_{s\_t} = 0 \\ \dfrac{\left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t \cdot \left[(EL_{tw} - EL_C) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_t \cdot \frac{1}{2}(EL_{tw} - EL_C)^2 \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{s\_t}} & \text{otherwise} \end{cases}$$

$$y_{s\_t} = 0.11 \cdot m$$

Lateral soil moment at stem base - Toe Side

$$M_{s\_t} := P_{s\_t} \cdot y_{s\_t} = 0.07 \cdot kN \cdot m$$

Soil pressure at saturation level - Heel Side

$$p_h := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0kPa & \text{otherwise} \end{cases} = 32.63 \cdot kPa$$

Soil pressure at stem base - Heel Side

$$p_{C.h} := \begin{cases} p_h + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_C) & \text{if } EL_B > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.h} = 32.63 \cdot kPa$$

Lateral soil loads at stem base - Heel Side

$$P_{s\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_h + p_h \cdot (EL_{hw} - EL_C) \ldots + 0.5 \cdot (p_{C.h} - p_h) \cdot (EL_{hw} - EL_C)\right] \cdot b = 44.87 \cdot kN$$

Resultant location

$$y_{s\_h} := \begin{cases} 0 & \text{if } P_{s\_h} = 0 \\ \dfrac{\left[0.5\cdot(EL_B - EL_{hw})\cdot p_h\cdot\left[(EL_{hw} - EL_C) + \frac{1}{3}(EL_B - EL_{hw})\right] + p_h\cdot\frac{1}{2}(EL_{hw} - EL_C)^2 \ldots \\ + 0.5\cdot(p_{C.h} - p_h)\cdot(EL_{hw} - EL_C)^2\cdot\frac{1}{3}\right]\cdot b}{P_{s\_h}} & \text{otherwise} \end{cases}$$

$$y_{s\_h} = 0.92\cdot m$$

Lateral soil moment at stem base - Heel Side $\quad M_{s\_h} := P_{s\_h}\cdot y_{s\_h} = 41.13\cdot kN\cdot m$

13.1.3 Surcharge Loads at Stem Base

Surcharge load at stem base $\quad P_{sur\_stem} := p_{sur}\cdot(EL_B - EL_C)\cdot b = 32.63\cdot kN$

Surcharge Moment about Toe $\quad M_{sur\_stem} := P_{sur}\cdot\frac{1}{2}(EL_B - EL_C) = 77.5\cdot kN\cdot m$

13.2 Shear and Moment on Heel - See Figure 5

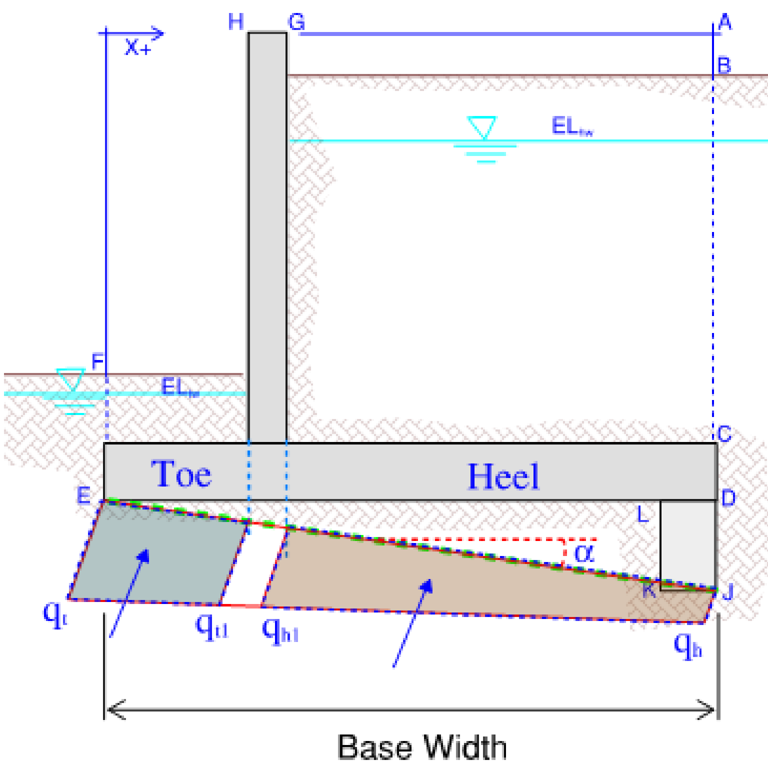

Figure 5 - Loads on Base (Heel & Toe)

13.2.1 Weight of Concrete Heel

Weight of Wall footing/base $W_{c\_heel} := \gamma_c \cdot (t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}) \cdot b = 39.36 \cdot kN$

Resultant location $x_{c\_heel} := \dfrac{\left[\dfrac{1}{2} t_{base} \cdot L_{heel}{}^2 \ldots \\ + t_{key} \cdot h_{key} \cdot (L_{heel} - 0.5 t_{key})\right]}{t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}} = 1.31\ m$

Moment about stem base $M_{c\_heel} := W_{c\_heel} \cdot x_{c\_heel} = 51.66 \cdot kN \cdot m$

13.2.2 Weight of Soil on Heel

Weight of Soil on heel $W_{s\_heel} := W_{soil\_h} = 110 \cdot kN$

Moment about stem base $M_{s\_heel} := W_{s\_heel} \cdot \left(\dfrac{1}{2} L_{heel}\right) = 110 \cdot kN \cdot m$

13.2.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_heel} := W_{w\_h} = 0 \cdot kN$

Moment about stem base $M_{w\_heel} := W_{w\_heel} \cdot \left(\dfrac{1}{2} L_{heel}\right) = 0 \cdot kN \cdot m$

13.2.4 Weight of Concrete Toe

Weight of Wall footing/base $W_{c\_toe} := \gamma_c \cdot t_{base} \cdot L_{toe} \cdot b = 8.81 \cdot kN$

Moment about stem base $M_{c\_toe} := W_{c\_toe} \cdot \left(\dfrac{1}{2} \cdot L_{toe}\right) = 3.3 \cdot kN \cdot m$

13.2.5 Weight of Soil on Toe

Weight of Soil on Toe $W_{s\_toe} := W_{soil\_t} = 5 \cdot kN$

Moment about stem base $M_{s\_toe} := W_{s\_toe} \cdot \left(\dfrac{1}{2} L_{toe}\right) = 1.9 \cdot kN \cdot m$

13.2.6 Weight of Water on Toe

Weight of Water on Toe $W_{w\_toe} := W_{w\_t} = 0 \cdot kN$

Moment about stem base $M_{w\_toe} := W_{w\_toe} \cdot \left(\dfrac{1}{2} L_{toe}\right) = 0 \cdot kN \cdot m$

13.2.7 Bearing Pressures on Footing

Approx. Base in Compression	$l_{comp.s} = 3.58\,m$
Effective base pressure at Toe	$q_t = 136.06 \cdot kPa$
Effective base pressure at Heel	$q_h = 2.10 \cdot kPa$
Compression length under Toe	$L_{bearing\_t} := \dfrac{L_{toe}}{\cos(\alpha)} = 0.83\,m$
Compression length under Heel	$L_{bearing\_h} := l_{comp.s} - \dfrac{(x_G - x_E)}{\cos(\alpha)} = 2.2\,m$
Bearing pressure under toe side of stem	$q_{t1} := L_{bearing\_t} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 105.15 \cdot kPa$
Bearing pressure under heel side of stem	$q_{h1} := \dfrac{(x_G - x_E)}{\cos(\alpha)} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 84.54 \cdot kPa$

13.2.8 Soil Reaction on Heel

Soil reaction load on Heel	$P_{bearing\_h} := \dfrac{1}{2} \cdot (q_h + q_{h1}) \cdot L_{bearing\_h} \cdot b = 95.42 \cdot kN$
Resultant location	$x_{bearing\_h} := \dfrac{L_{bearing\_h}}{2} + \dfrac{L_{bearing\_h}}{6} \cdot \dfrac{(q_h - q_{h1})}{q_{h1} + q_h} = 0.75\,m$
Vertical Component	$P_{h\_v} := P_{bearing\_h} \cdot \cos(\alpha) = 86.64 \cdot kN$
Horizontal Component	$P_{h\_h} := P_{bearing\_h} \cdot \sin(\alpha) = 39.99 \cdot kN$
Horizontal Moment Arm	$x_{h\_h} := x_{bearing\_h} \cdot \cos(\alpha) = 0.68\,m$
Vertical Moment Arm	$y_{h\_v} := \left[\dfrac{(x_G - x_E)}{\cos(\alpha)} + x_{bearing\_h}\right] \cdot \sin(\alpha) = 0.89\,m$
Moment on Heel	$M_{bearing\_h} := P_{h\_v} \cdot x_{h\_h} + P_{h\_h} \cdot y_{h\_v} = 94.83 \cdot kN \cdot m$

13.2.9 Soil Reaction on Toe

Soil reaction load on Toe $P_{bearing\_t} := \frac{1}{2} \cdot (q_t + q_{t1}) \cdot L_{bearing\_t} \cdot b = 99.62 \cdot kN$

Resultant location $x_{bearing\_t} := \frac{L_{bearing\_t}}{2} + \frac{L_{bearing\_t}}{6} \cdot \frac{(q_t - q_{t1})}{q_t + q_{t1}} = 0.43\ m$

Vertical Component $P_{t\_v} := P_{bearing\_t} \cdot \cos(\alpha) = 90.45 \cdot kN$

Horizontal Component $P_{t\_h} := P_{bearing\_t} \cdot \sin(\alpha) = 41.75 \cdot kN$

Horizontal Moment Arm $x_{t\_h} := x_{bearing\_t} \cdot \cos(\alpha) = 0.39\ m$

Vertical Moment Arm $y_{t\_v} := (L_{bearing\_t} - x_{bearing\_t}) \cdot \sin(\alpha) = 0.17\ m$

Moment on Toe $M_{bearing\_t} := P_{t\_v} \cdot x_{t\_h} + P_{t\_h} \cdot y_{t\_v} = 42.29 \cdot kN \cdot m$

13.2.10 Uplift Pressure on Footing - Figure 6

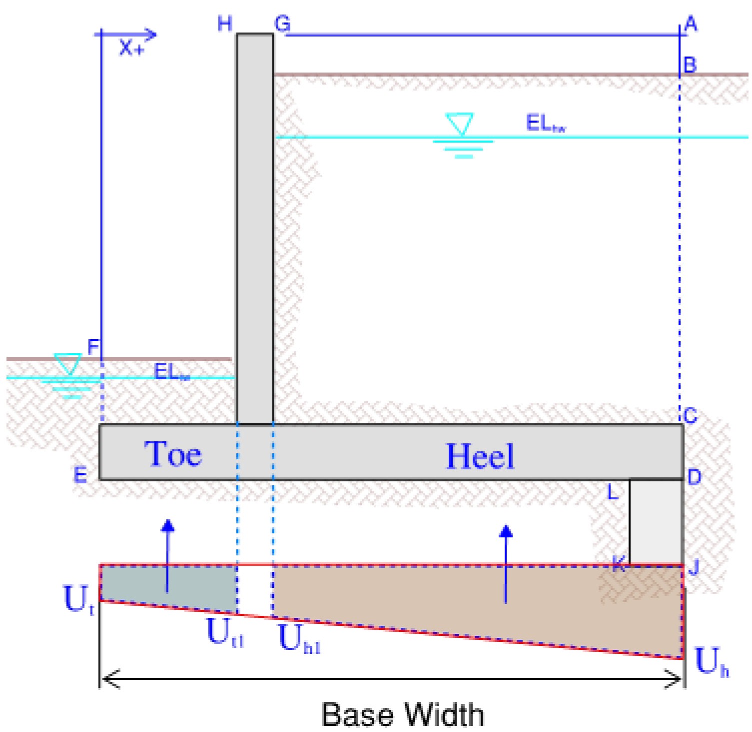

Figure 6 - Uplift Loads on Base (Heel & Toe)

Uplift pressure under toe side of stem $u_{t1} := L_{toe} \cdot \left[\frac{(u_h - u_t)}{L_{base}} \right] + u_t = 8.3 \cdot kPa$

Uplift pressure under heel side of stem $u_{h1} := (x_G - x_E) \cdot \left[\frac{(u_h - u_t)}{L_{base}} \right] + u_t = 10.56 \cdot kPa$

13.2.11 Uplift Loads Heel

Uplift load on Heel $P_{u\_h} := \frac{1}{2} \cdot (u_h + u_{h1}) \cdot L_{heel} \cdot b = 30.18 \cdot kN$

Moment Arm $x_{u\_h} := \frac{L_{heel}}{2} + \frac{L_{heel}}{6} \cdot \frac{(u_h - u_{h1})}{u_{h1} + u_h} = 1.1\, m$

Moment on Heel $M_{u\_h} := P_{u\_h} \cdot x_{u\_h} = 33.2 \cdot kN \cdot m$

13.2.12 Uplift Loads Toe

Uplift load on Toe $P_{u\_t} := \frac{1}{2} \cdot (u_t + u_{t1}) \cdot L_{toe} \cdot b = 4.95 \cdot kN$

Moment Arm $x_{u\_t} := \frac{L_{toe}}{2} + \frac{L_{toe}}{6} \cdot \frac{(u_t - u_{t1})}{u_{t1} + u_t} = 0.34\, m$

Moment on Toe $M_{u\_t} := P_{u\_t} \cdot x_{u\_t} = 1.7 \cdot kN \cdot m$

13.3 Structural Load Summary

Net shear at stem base $V_{stem} := P_{hw\_stem} - P_{tw\_stem} + P_{s\_h} - P_{s\_t} + P_{sur\_stem} = 76.8 \cdot kN$

Net moment at stem base $M_{stem} := M_{hw\_stem} - M_{tw\_stem} + M_{s\_h} - M_{s\_t} + M_{sur\_stem} = 118.5 \cdot kN \cdot m$

Net shear on Toe $V_t := W_{c\_toe} + W_{s\_toe} + W_{w\_toe} - P_{t\_v} - P_{u\_t} = -81.6 \cdot kN$

Net moment on Toe $M_t := M_{c\_toe} + M_{s\_toe} + M_{w\_toe} - M_{bearing\_t} - M_{u\_t} = -38.8 \cdot kN \cdot m$

Net shear on Heel $V_h := W_{c\_heel} + W_{s\_heel} + W_{w\_heel} - P_{h\_v} - P_{u\_h} = 32.5 \cdot kN$

Net moment on Heel $M_h := M_{c\_heel} + M_{s\_heel} + M_{w\_heel} - M_{bearing\_h} - M_{u\_h} = 33.6 \cdot kN \cdot m$

13.4 Controlling Structural Loads (Unfactored)

Stem cross section

$M_{stem} = 118.5 \cdot kN \cdot m$

$V_{stem} = 76.8 \cdot kN$

Toe cross section

$M_{toe} := M_t = -38.81 \cdot kN \cdot m$

$V_{toe} := V_t = -81.6 \cdot kN$

Heel cross section

$M_{heel} := \min\left(\max\left(M_{stem} - \left|M_{toe}\right|, M_h\right), M_{stem}\right) = 79.7 \cdot kN \cdot m$

STABILITY ANALYSIS FOR CANTILEVER WALL WITH KEY

Project / Client: Springbank Off-Stream Storage (SR1) / Alberta Transportation

Section Location: Intake Structure Wing Wall - Closest to Intake Structure

1.0 OBJECTIVE

For a particular load condition, analyze a reinforced concrete cantilever wall with shear key for overturning, sliding, flotation, and bearing capacity in accordance with criteria described in the listed references.

2.0 BACKGROUND INFORMATION

2.1 DATA SOURCES

1- Soils Report - Recommended Geotechnical Soil Parameters, SR-1 Low Level Outlet (LLO) Structures. July 19, 2019

2- Drawings - Design Drawings

3- Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM) , 2019

2.2 REFERENCES

1. (CDA) Dam Safety Guidelines, 2007 (revised 2013).

2. "Water Control Structures Selected Design Guidelines," Alberta Transportation & Alberta Environment, Calgary Alberta, November 2004.

3.0 DESIGN PARAMETERS AND CRITERIA

3.1 Stability Analysis Criteria (Data source 2)

Load Case	$LC := 3$
Load Case Description	$vlookup(LC, CASES, 1)_0 =$ "Rapid Drawdown"
Sliding Minimum Factor of Safety	$FS_{Sliding} := vlookup(LC, CASES, 2)_0 = 1.1$
Overturning Criteria	$Base\_Comp_{Req} := vlookup(LC, CASES, 3)_0 = 75 \cdot \%$
Bearing Capacity Minimum Factor of Safety	$FS_{Bearing} := vlookup(LC, CASES, 4)_0 = 1$
Flotation Minimum Factor of Safety	$FS_{float} := vlookup(LC, CASES, 5)_0 = 1.1$

3.2 Material Properties - Data Source 1 Unless Otherwise Noted

Unit Weight of Water	$\gamma_w := 9.81\,\frac{kN}{m^3}$	
Unit Weight of Concrete	$\gamma_c := 23.5\cdot\frac{kN}{m^3}$	Data Source 3
Unit Weight of Soil (Moist)	$\gamma_{soilm} := 20\,\frac{kN}{m^3}$	
Soil Unit Weight Beneath Base (Saturated)	$\gamma_{soilsat} := 20\,\frac{kN}{m^3}$	
Soil Cohesion - Drained	$c_{soil} := 0kPa$	
Soil Angle of Internal Friction - Drained	$\phi_{soil} := 24deg$	
Soil Ultimate Bearing Pressure	$Q_b := 150kPa$	
Slope of backfill (Conservative)	$\beta := 0$	
At-rest lateral earth pressure coefficient	$k_o := 1 - \sin(\phi_{soil}) = 0.59$	

4.0 WALL SECTION DESCRIPTION

4.1 Point Locations (Refer to Figure 1 and Drawings)

A - Top of wall	$EL_A := 1189.9m$	$x_A := 3.25m$
B - Top of fill - reservoir side	$EL_B := 1189.75m$	$x_B := x_A = 3.25\cdot m$
C - Top of Heel	$EL_C := 1187m$	$x_C := x_A = 3.25\cdot m$
D - Heel side end of footing	$EL_D := EL_C - 500mm = 1186.50\,m$	$x_D := x_A = 3.25\cdot m$
E - Toe side end of footing	$EL_E := EL_D = 1186.50\cdot m$	$x_E := 0m$
F - Top of Fill - land side	$EL_F := EL_C + 0.333m = 1187.33\cdot m$	$x_F := x_E = 0$
G - Heel side face of wall stem	$EL_G := EL_A = 1189.90\cdot m$	$x_G := 1.25m$
H - Toe side face of wall stem	$EL_H := EL_A = 1189.90\cdot m$	$x_H := x_G - 0.500m = 0.75\cdot m$

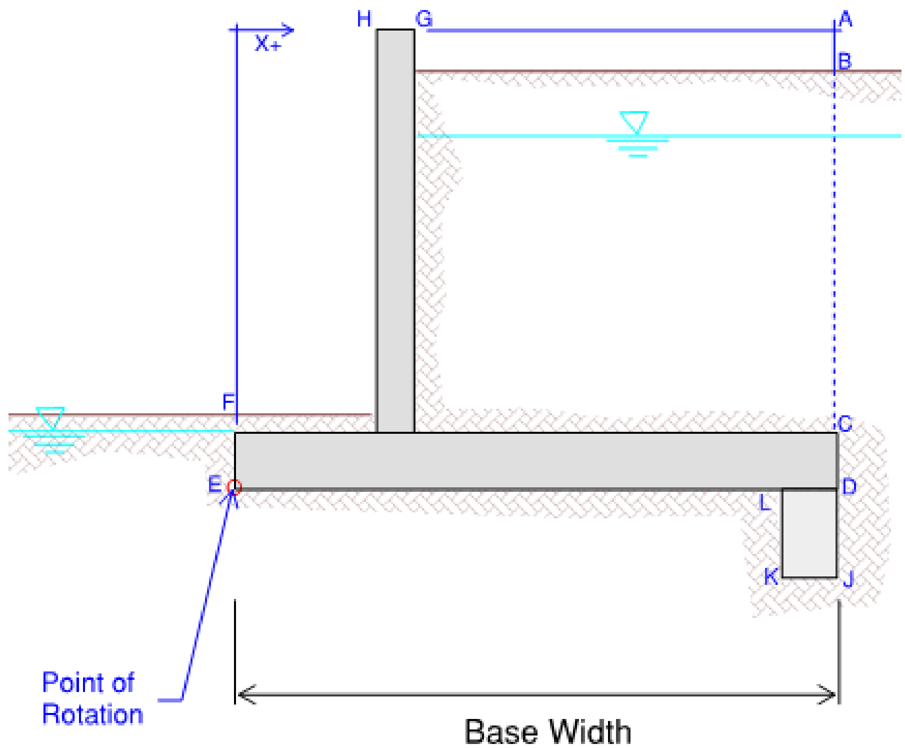

Figure 1. Cantilever Wall Section

J - Bottom of key - heel side	$EL_J := EL_C - 2m = 1185.00 \cdot m$	$x_J := x_D = 3.25\,m$
K - Bottom of key - toe side	$EL_K := EL_J = 1185.00 \cdot m$	$x_K := x_J - 450mm = 2.8 \cdot m$
L - Top of key	$EL_L := EL_D = 1186.50 \cdot m$	$x_L := x_K = 2.8\,m$

Applied Loads Data Source 2

Heel side water elevation

$$EL_{hw} := \begin{cases} EL_B & \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 1)_0 \cdot 1m\right) & \text{otherwise} \end{cases} = 1189.75$$

Toe side water elevation

$$EL_{tw} := \begin{cases} EL_F & \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 2)_0 \cdot 1m\right) & \text{otherwise} \end{cases} = 1187.33$$

Equivalent soil surcharge:

$$h_{sur} := \begin{cases} 1.0m & \text{if } LC = 2 \\ 0 & \text{otherwise} \end{cases} = 0 \cdot m$$

4.2 Additional Analysis Dimensions

Analysis Width $b := 1m$

Length of base $L_{base} := x_D - x_E = 3.25 \cdot m$

Thickness of base $t_{base} := EL_C - EL_D = 500 \cdot mm$

Length of stem $L_{stem} := EL_A - EL_C = 2.9 \cdot m$

Thickness of stem $t_{stem} := x_G - x_H = 500 \cdot mm$

Length of Heel $L_{heel} := x_A - x_G = 2000 \cdot mm$

Length of Toe $L_{toe} := x_H - x_F = 750 \cdot mm$

Thickness of Key $t_{key} := x_J - x_K = 450 \cdot mm$

Height of Key $h_{key} := EL_D - EL_J = 1500 \cdot mm$

5.0 UPLIFT & HYDROSTATIC LOADS

5.1 Uplift Pressures for Stability Analyses

Determine water pressures for designated coordinates using full headwater uplift pressure at the heel and full tailwater uplift pressure at the toe. Uplift distribution is assumed linear from heel to toe.

Hydrostatic pressure at Heel $u_h := \gamma_w \cdot \left(EL_{hw} - EL_J\right) = 47 \cdot kPa$

Hydrostatic pressure at Toe $u_t := \gamma_w \cdot \left(EL_{tw} - EL_E\right) = 8 \cdot kPa$

Total uplift loads on base $P_u := \frac{\left(u_h + u_t\right)}{2} \cdot L_{base} \cdot b = 89 \cdot kN$

Uplift resultant location $x_u := \frac{L_{base}}{2} + \frac{L_{base}}{6} \cdot \frac{\left(u_h - u_t\right)}{u_t + u_h} = 2.01 \cdot m$

Uplift Moment about Toe $M_u := P_u \cdot x_u = 178.4 \cdot kN \cdot m$

5.2 Headwater Hydrostatic Load - Heel Side

Headwater hydrostatic load
$$P_{hw} := \frac{1}{2} u_h \cdot (EL_{hw} - EL_J) \cdot b = 110.7 \cdot kN$$

Headwater moment arm
$$y_{hw} := \frac{1}{3}(EL_{hw} - EL_J) - h_{key} = 0.08 \cdot m$$

Headwater Moment about Toe
$$M_{hw} := P_{hw} \cdot y_{hw} = 9.2 \cdot kN \cdot m$$

5.3 Tailwater Hydrostatic Load - Toe Side

Tailwater hydrostatic load
$$P_{tw} := \frac{1}{2} \gamma_w \cdot (EL_{tw} - EL_K)^2 \cdot b = 26.70 \cdot kN$$

Tailwater moment arm
$$y_{tw} := h_{key} - \frac{1}{3}(EL_{tw} - EL_K) = 0.72 \cdot m$$

Tailwater Moment about Toe
$$M_{tw} := P_{tw} \cdot y_{tw} = 19.28 \cdot kN \cdot m$$

6.0 LATERAL EARTH PRESSURE

6.1 Lateral Soil Load on Toe Side

Soil pressure at Saturation Level
$$p_{tw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 0.0 \cdot kPa$$

Soil pressure at Toe - base elevation
$$p_E := \begin{cases} p_{tw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_J) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_J) & \text{otherwise} \end{cases}$$

$$p_E = 14.1 \cdot kPa$$

Total soil loads on Wall
$$P_{soil\_t} := \begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} + p_{tw} \cdot (EL_{tw} - EL_J) \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J) \end{bmatrix} \cdot b = 16.45 \cdot kN$$

Resultant location

$$y_{soil\_t} := \begin{cases} 0 & \text{if } P_{soil\_t} = 0 \\ h_{key} - \dfrac{\begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} \cdot \left[(EL_{tw} - EL_J) + \frac{1}{3}(EL_F - EL_{tw}) \right] + p_{tw} \cdot \frac{1}{2} (EL_{tw} - EL_J)^2 \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)^2 \cdot \frac{1}{3} \end{bmatrix} \cdot b}{P_{soil\_t}} & \text{otherwise} \end{cases}$$

$$y_{soil\_t} = 0.72 \cdot m$$

Moment about Toe $M_{soil\_t} := P_{soil\_t} \cdot y_{soil\_t} = 11.88 \cdot kN \cdot m$

6.2 Lateral Soil Load on Heel Side

Soil pressure at Saturation Level

$$p_{hw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0psf & \text{otherwise} \end{cases} = 0.0 \cdot kPa$$

Soil pressure at Heel - base elevation

$$p_D := \begin{cases} p_{hw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_J) & \text{if } EL_B > EL_{hw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_J) & \text{otherwise} \end{cases}$$

$$p_D = 28.72 \cdot kPa$$

Total soil loads on Base

$$P_{soil\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} + p_{hw} \cdot (EL_{hw} - EL_J) \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)\right] \cdot b$$

$$P_{soil\_h} = 68.2 \cdot kN$$

Resultant location

$$y_{soil\_h} := \frac{\left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} \cdot \left[EL_{hw} - EL_J + \frac{1}{3}(EL_B - EL_{hw})\right] + p_{hw} \cdot \frac{1}{2}(EL_{hw} - EL_J)^2 \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{soil\_h}} - h_{key}$$

$$y_{soil\_h} = 0.08 \cdot m$$

Moment about Toe $M_{soil\_h} := P_{soil\_h} \cdot y_{soil\_h} = 5.7 \cdot kN \cdot m$

6.3 Surcharge Soil Load - Heel Side

Surcharge soil pressure $p_{sur} := k_o \cdot \gamma_{soilm} \cdot h_{sur} = 0 \cdot kPa$

Soil load on wall $P_{sur} := p_{sur} \cdot (EL_B - EL_J) \cdot b = 0 \cdot kN$

Resultant location $y_{sur} := \frac{1}{2} \cdot (EL_B - EL_J) - h_{key} = 0.88\, m$

Moment about Toe $M_{sur} := P_{sur} \cdot y_{sur} = 0 \cdot kN \cdot m$

7.0 GRAVITY LOADS

7.1 Weight of Concrete

Weight of Wall footing/base $W_{conc} := \gamma_c \cdot (t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}) \cdot b = 88.13 \cdot kN$

Resultant location

$$x_{conc} := \frac{\left[\frac{1}{2} t_{base} \cdot L_{base}^2 + L_{stem} \cdot t_{stem} \cdot (L_{toe} + 0.5 t_{stem}) \ldots + t_{key} \cdot h_{key} \cdot (L_{base} - 0.5 t_{key})\right]}{t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}} = 1.64\,m$$

Moment about Toe $M_{conc} := W_{conc} \cdot x_{conc} = 144.11 \cdot kN \cdot m$

7.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{soil\_h} := b \cdot L_{heel} \cdot \begin{cases} (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{if } EL_B < EL_{hw} \\ \gamma_{soilm} \cdot (EL_B - EL_{hw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max[0, (EL_{hw} - EL_C)] & \text{otherwise} \end{cases}$$

$W_{soil\_h} = 56.05 \cdot kN$

Resultant location $x_{soil\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{soilw\_h} := W_{soil\_h} \cdot x_{soil\_h} = 126.1 \cdot kN \cdot m$

7.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_h} := \gamma_w \cdot \max[0kip, (EL_{hw} - EL_C)] \cdot L_{heel} \cdot b = 53.95 \cdot kN$

Resultant location $x_{w\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{w\_h} := W_{w\_h} \cdot x_{w\_h} = 121.4 \cdot kN \cdot m$

7.4 Weight of Soil on Toe

Weight of Soil on toe Note: Water and soil elevations MUST NOT be below footing elevation

$$W_{soil\_t} := b \cdot L_{toe} \cdot \begin{cases} (\gamma_{soilsat} - \gamma_w) \cdot (\max(0, EL_F - EL_C)) & \text{if } EL_F < EL_{tw} \\ \gamma_{soilm} \cdot \max(0, EL_F - EL_{tw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max(EL_{tw} - EL_C, 0) & \text{otherwise} \end{cases}$$

$W_{soil\_t} = 2.54 \cdot kN$

Resultant location $x_{soil\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

Moment about Toe $M_{soilw\_t} := W_{soil\_t} \cdot x_{soil\_t} = 1 \cdot kN \cdot m$

7.5 Weight of Water on Toe

Weight of Water on toe $W_{w\_t} := \gamma_w \cdot \max\left[0kip, \left(EL_{tw} - EL_C\right)\right] \cdot L_{toe} \cdot b = 2.45 \cdot kN$

Resultant location $x_{w\_t} := 0.5\left(x_H - x_E\right) = 0.38 \cdot m$

Moment about Toe $M_{w\_t} := W_{w\_t} \cdot x_{w\_t} = 0.9 \cdot kN \cdot m$

7.6 Weight of Soil under Footing and Above Failure Plane EJ

Depth of Soil Wedge Near Key $h_{s\_under} := \left(x_L - x_E\right) \cdot \frac{h_{key}}{L_{base}} = 1.29\,m$

Length of Soil Wedge $L_{s\_under} := x_L - x_E = 2.8\,m$

Weight of Soil Wedge Under Footing $W_{s\_under} := \gamma_{soilsat} \cdot \left(0.5 \cdot h_{s\_under} \cdot L_{s\_under}\right) \cdot b = 36.18 \cdot kN$

Resultant location $x_{s\_under} := \frac{2}{3}\left(x_L - x_E\right) = 1.87 \cdot m$

Moment about Toe $M_{s\_under} := W_{s\_under} \cdot x_{s\_under} = 67.5 \cdot kN \cdot m$

8.0 Overturning Stability Assessment - See Figure 2

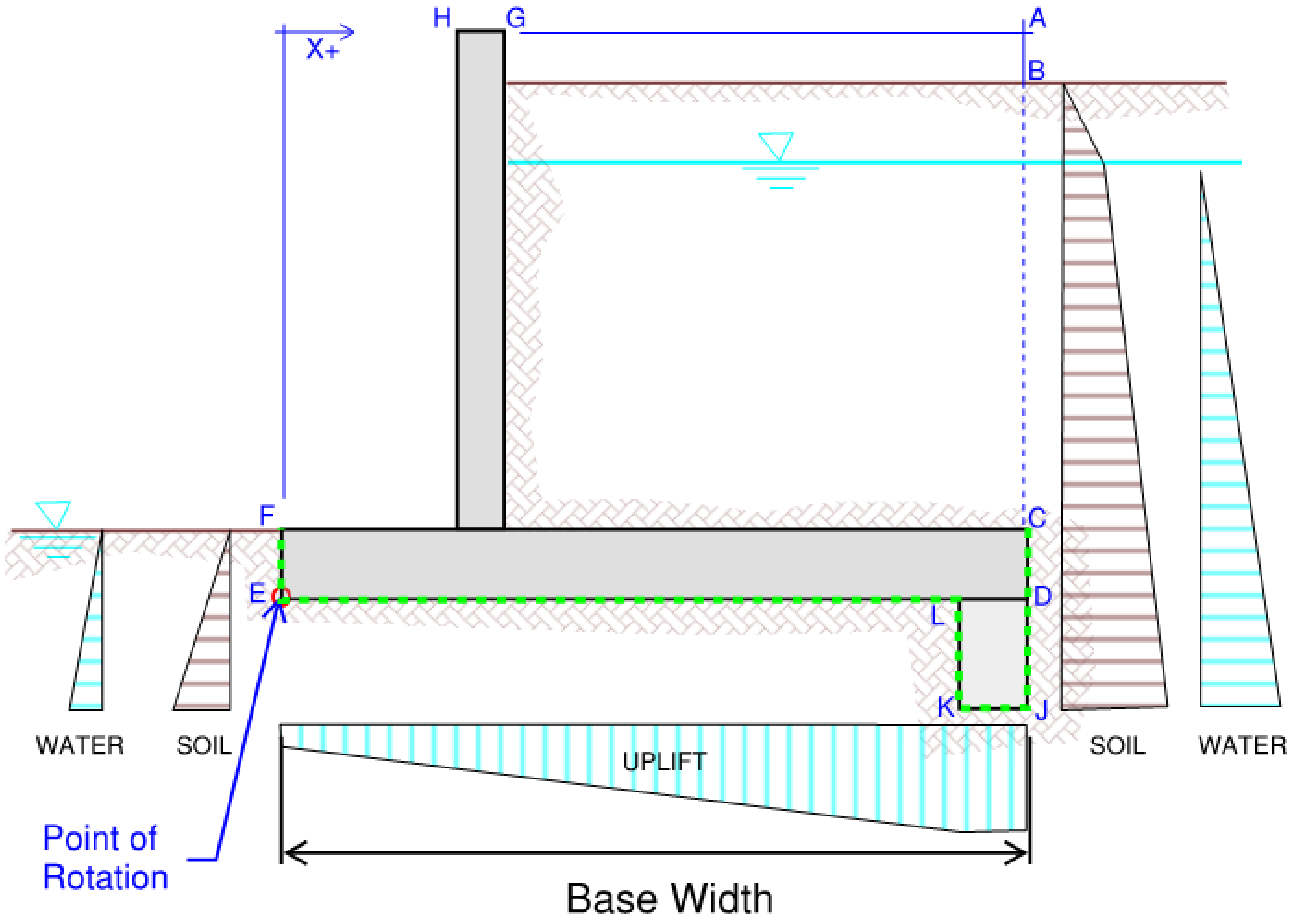

Figure 2. Free Body Diagram for Overturning Analysis

Uplift loads for Overturning

$$P_{u\_ot} := \left[\frac{1}{2}(u_h + u_t)\cdot(x_L - x_E) + u_h\cdot t_{key}\right]\cdot b = 97.65\cdot kN$$

Uplift resultant location

$$x_{u\_ot} := \frac{\left[\left[\frac{x_L - x_E}{2} + \frac{x_L - x_E}{6}\cdot\frac{(u_h - u_t)}{u_t + u_h}\right]\cdot\left[\frac{1}{2}(u_h + u_t)\cdot(x_L - x_E)\right] \ldots \atop + (L_{base} - 0.5t_{key})\cdot(u_h\cdot t_{key})\right]}{\left[\frac{1}{2}(u_h + u_t)\cdot(x_L - x_E) + u_h\cdot t_{key}\right]}$$

$$x_{u\_ot} = 2.01\ m$$

Uplift Moment about Toe

$$M_{u\_ot} := P_{u\_ot}\cdot x_{u\_ot} = 195.9\cdot kN\cdot m$$

Total Vertical Forces $\Sigma V_{ot} := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t} - P_{u\_ot} = 105.5 \cdot kN$

Total Horizontal Forces $\Sigma H_{ot} := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 135.72 \cdot kN$

Total Resisting Moments $\Sigma M_{r\_ot} := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} = 393.5 \cdot kN \cdot m$

Total Driving Moments $\Sigma M_{d\_ot} := M_{hw} + M_{soil\_h} + M_{sur} + M_{u\_ot} \cdots + M_{tw} + M_{soil\_t} = 242 \cdot kN \cdot m$

Resultant Location from Toe $x_{r\_ot} := \dfrac{\Sigma M_{r\_ot} - \Sigma M_{d\_ot}}{\Sigma V_{ot}} = 1.44 \cdot m$

Normalized Resultant Location $\dfrac{x_{r\_ot}}{L_{base}} = 0.442$

Eccentricity $e_{x\_ot} := \dfrac{L_{base}}{2} - x_{r\_ot} = 0.19 \cdot m$

Approx. Base in Compression $l_{comp\_ot} := \min\left[L_{base}, \dfrac{3}{2} \cdot \left(L_{base} - 2 \cdot e_{x\_ot}\right)\right] = 3.25 \cdot m$

Percent Base in Compression $\boxed{Base\_Comp := \left(\dfrac{l_{comp\_ot}}{L_{base}}\right) = 100 \cdot \%}$

Resultant Location Check $check_{res} := if\left(Base\_Comp \geq Base\_Comp_{Req}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

9.0 Flotation Stability Assessment - See Figure 2

Calculated Flotation Safety Factor $\boxed{FS_f := \dfrac{W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}}{P_{u\_ot}} = 2.1}$

Flotation Stability Check $check_{floatation} := if\left(FS_f \geq FS_{float}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

10.0 Sliding Stability Assessment - See Figure 3

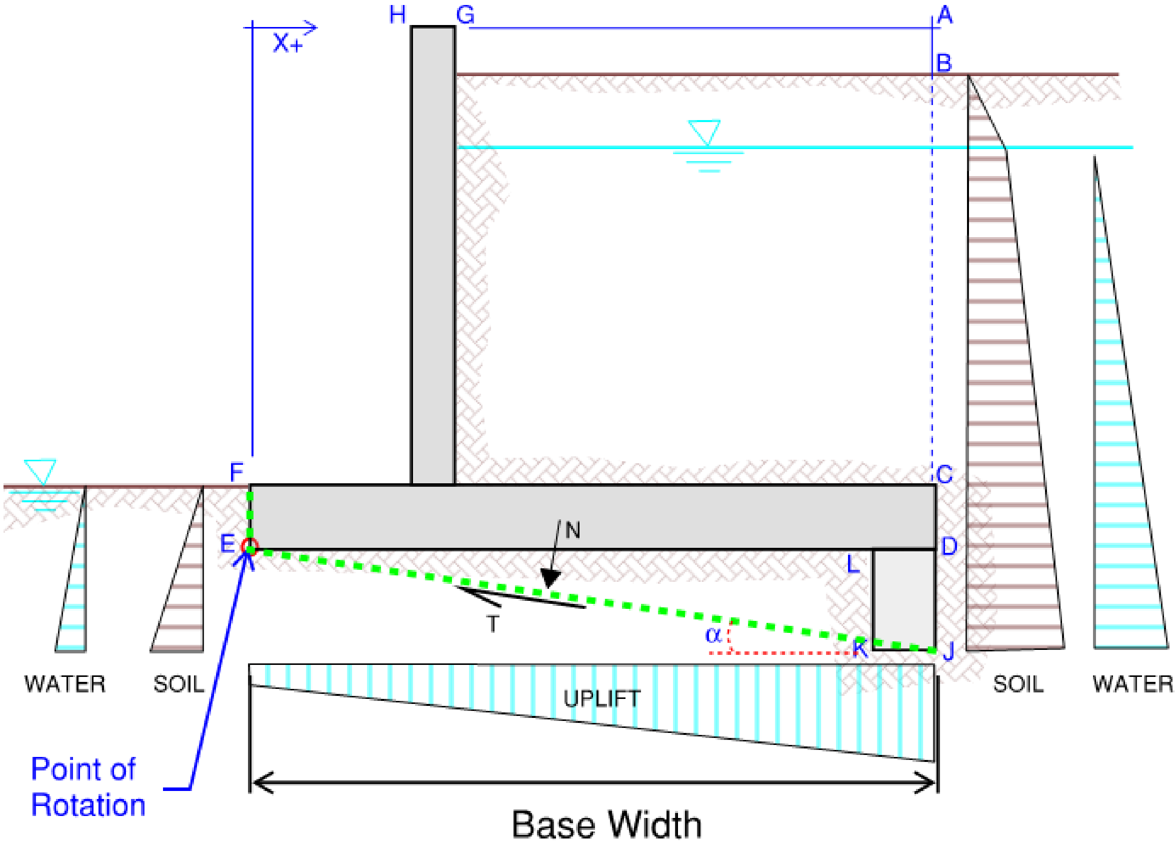

Figure 3. Free Body Diagram for Sliding Analysis

Length of Sliding Failure Plane, EJ $\quad L_{fp} := \sqrt{L_{base}^{\;2} + h_{key}^{\;2}} = 3.58\,m$

Angle of Sliding Failure Plane From Horizontal $\quad \alpha := \operatorname{atan}\left(\dfrac{h_{key}}{L_{base}}\right) = 24.8 \cdot deg$

Total Vertical Forces $\quad \Sigma V := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{s\_under} + W_{w\_t} - P_u = 150.3 \cdot kN$

Total Horizontal Forces $\quad \Sigma H := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 135.72 \cdot kN$

Total Resisting Moments $\quad \Sigma M_r := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} + M_{s\_under} = 461\ m \cdot kN$

Total Driving Moments $\quad \Sigma M_d := M_{hw} + M_{soil\_h} + M_{sur} + M_u \cdots + M_{tw} + M_{soil\_t} = 224.5 \cdot kN \cdot m$

Normal Force on Sliding Failure Plane: $N_s := \Sigma H \cdot \sin(\alpha) + \Sigma V \cdot \cos(\alpha) = 193.34 \cdot kN$

Tangential Force on Sliding Failure Plane: $T_s := \Sigma H \cdot \cos(\alpha) - \Sigma V \cdot \sin(\alpha) = 60.24 \cdot kN$

Calculated Sliding Safety Factor $\boxed{FS_s := \frac{\left|N_s \cdot \tan(0.95\phi_{soil})\right|}{\left|T_s\right|} = 1.35}$

Sliding Stability Check $check_{sliding} := if\left(FS_s \geq FS_{Sliding}, "OK", "NG"\right) = "OK"$

11.0 Bearing Capacity Assessment

Resultant Location from Toe $x_r := \frac{\Sigma M_r - \Sigma M_d}{N_s} = 1.22 \cdot m$

Eccentricity of N_s from center of base $e_s := \frac{L_{fp}}{2} - x_r = 0.57 \cdot m$

Approx. Base in Compression $l_{comp.s} := \min\left[L_{fp}, \frac{3}{2} \cdot \left(L_{fp} - 2 \cdot e_s\right)\right] = 3.58 \cdot m$

Updated Eccentricity $e_x := \frac{l_{comp.s} - L_{fp}}{2} + e_s = 0.57 \cdot m$

Effective base pressure at Toe $q_t := \left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 + \frac{6 \cdot e_x}{l_{comp.s}}\right) = 105.30 \cdot kPa$

Effective base pressure at Heel $q_h := \max\left[\left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 - \frac{6 \cdot e_x}{l_{comp.s}}\right), 0\right] = 2.73 \cdot kPa$

Calculated Bearing Safety Factor $\boxed{FS_b := \frac{Q_b}{\max\left(q_t, q_h\right)} = 1.42}$

Bearing Pressure Check $check_{bearing} := if\left(FS_b \geq FS_{Bearing}, "OK", "NG"\right) = "OK"$

12.0 Summary of Stability Assessments

Base Compression / Resultant Location	$Base\_Comp = 100 \cdot \%$	$check_{res} = "OK"$
Flotation Stability	$FS_f = 2.1$	$check_{floatation} = "OK"$
Sliding Stability	$FS_s = 1.3$	$check_{sliding} = "OK"$
Bearing Pressure	$FS_b = 1.4$	$check_{bearing} = "OK"$

13.0 Structural Loads

13.1 Shear and Moment at Stem Base - See Figure 4

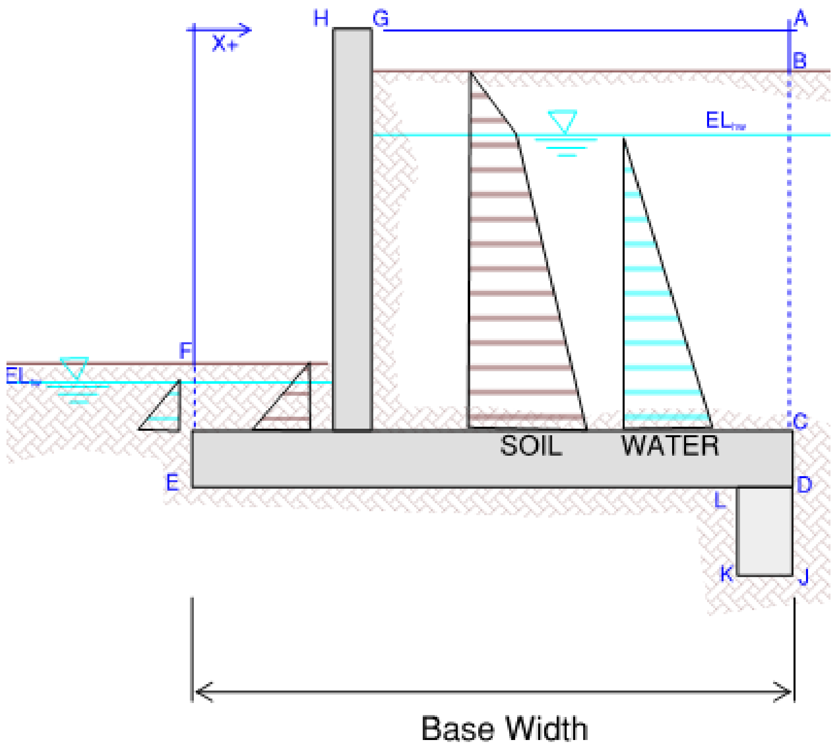

Figure 4 - Loads on Stem

13.1.1 Hydrostatic Load at Stem Base

Heel side hydrostatic load $P_{hw\_stem} := \frac{1}{2}\gamma_w \cdot (EL_{hw} - EL_C)^2 \cdot b = 37.1 \cdot kN$

Heel side moment at stem base $M_{hw\_stem} := P_{hw\_stem} \cdot \left(\frac{EL_{hw} - EL_C}{3}\right) = 34 \cdot kN \cdot m$

Toe side hydrostatic load $P_{tw\_stem} := \frac{1}{2}\gamma_w \cdot (EL_{tw} - EL_C)^2 \cdot b = 0.5 \cdot kN$

Toe side moment at stem base $M_{tw\_stem} := P_{tw\_stem} \cdot \left(\frac{EL_{tw} - EL_C}{3}\right) = 0.1 \cdot kN \cdot m$

13.1.2 Lateral Soil Loads at Stem Base

Soil pressure at saturation level - Toe Side

$$p_t := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 0.00 \cdot kPa$$

Soil pressure at stem base - Toe Side

$$p_{C.t} := \begin{cases} p_t + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_C) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.t} = 2.01 \cdot kPa$$

Lateral soil loads at stem base - Toe Side

$$P_{s\_t} := \left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t + p_t \cdot (EL_{tw} - EL_C) + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)\right] \cdot b = 0.34 \cdot kN$$

Resultant location

$$y_{s\_t} := \begin{cases} 0 & \text{if } P_{s\_t} = 0 \\ \dfrac{\left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t \cdot \left[(EL_{tw} - EL_C) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_t \cdot \frac{1}{2}(EL_{tw} - EL_C)^2 + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{s\_t}} & \text{otherwise} \end{cases}$$

$$y_{s\_t} = 0.11 \cdot m$$

Lateral soil moment at stem base - Toe Side

$$M_{s\_t} := P_{s\_t} \cdot y_{s\_t} = 0.04 \cdot kN \cdot m$$

Soil pressure at saturation level - Heel Side

$$p_h := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0kPa & \text{otherwise} \end{cases} = 0.00 \cdot kPa$$

Soil pressure at stem base - Heel Side

$$p_{C.h} := \begin{cases} p_h + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_C) & \text{if } EL_B > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.h} = 16.62 \cdot kPa$$

Lateral soil loads at stem base - Heel Side

$$P_{s\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_h + p_h \cdot (EL_{hw} - EL_C) + 0.5 \cdot (p_{C.h} - p_h) \cdot (EL_{hw} - EL_C)\right] \cdot b = 22.86 \cdot kN$$

Resultant location

$$y_{s\_h} := \begin{cases} 0 & \text{if } P_{s\_h} = 0 \\ \dfrac{\left[\begin{array}{l} 0.5\cdot(EL_B - EL_{hw})\cdot p_h\cdot\left[(EL_{hw} - EL_C) + \frac{1}{3}(EL_B - EL_{hw})\right] + p_h\cdot\frac{1}{2}(EL_{hw} - EL_C)^2 \;... \\ + 0.5\cdot(p_{C.h} - p_h)\cdot(EL_{hw} - EL_C)^2\cdot\frac{1}{3} \end{array}\right]\cdot b}{P_{s\_h}} & \text{otherwise} \end{cases}$$

$$y_{s\_h} = 0.92\cdot m$$

Lateral soil moment at stem base - Heel Side $M_{s\_h} := P_{s\_h}\cdot y_{s\_h} = 20.95\cdot kN\cdot m$

13.1.3 Surcharge Loads at Stem Base

Surcharge load at stem base $P_{sur\_stem} := p_{sur}\cdot(EL_B - EL_C)\cdot b = 0\cdot kN$

Surcharge Moment about Toe $M_{sur\_stem} := P_{sur}\cdot\frac{1}{2}(EL_B - EL_C) = 0\cdot kN\cdot m$

13.2 Shear and Moment on Heel - See Figure 5

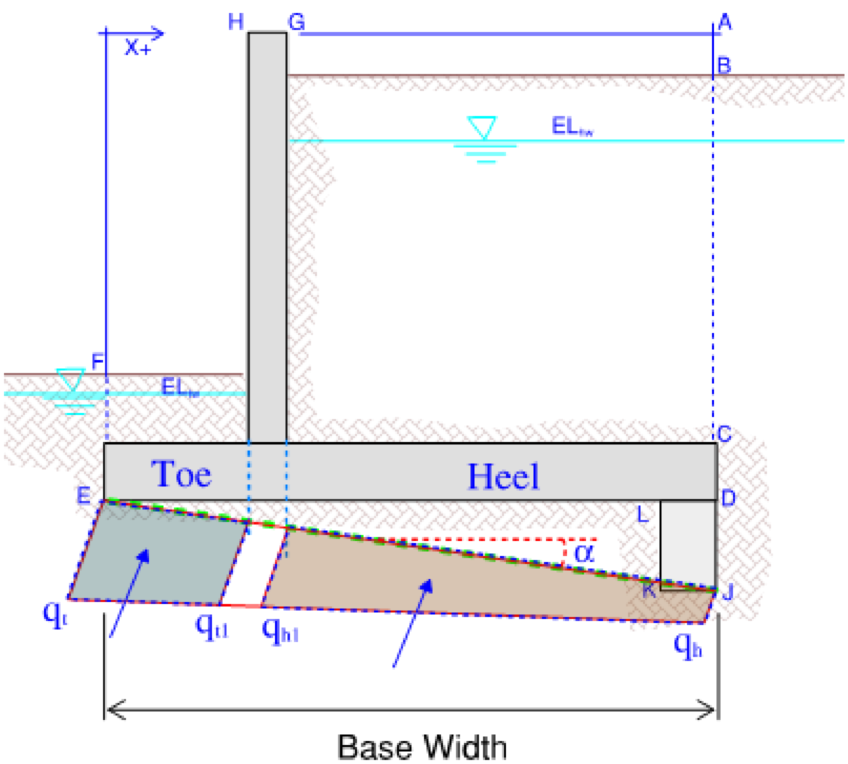

Figure 5 - Loads on Base (Heel & Toe)

13.2.1 Weight of Concrete Heel

Weight of Wall footing/base

$$W_{c\_heel} := \gamma_c \cdot \left(t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}\right) \cdot b = 39.36 \cdot kN$$

Resultant location

$$x_{c\_heel} := \frac{\begin{bmatrix} \frac{1}{2} t_{base} \cdot L_{heel}^{\ 2} \ldots \\ + t_{key} \cdot h_{key} \cdot \left(L_{heel} - 0.5 t_{key}\right) \end{bmatrix}}{t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}} = 1.31\,m$$

Moment about stem base

$$M_{c\_heel} := W_{c\_heel} \cdot x_{c\_heel} = 51.66 \cdot kN \cdot m$$

13.2.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{s\_heel} := W_{soil\_h} = 56.05 \cdot kN$$

Moment about stem base

$$M_{s\_heel} := W_{s\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 56 \cdot kN \cdot m$$

13.2.3 Weight of Water on Heel

Weight of Water on heel

$$W_{w\_heel} := W_{w\_h} = 53.95 \cdot kN$$

Moment about stem base

$$M_{w\_heel} := W_{w\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 54 \cdot kN \cdot m$$

13.2.4 Weight of Concrete Toe

Weight of Wall footing/base

$$W_{c\_toe} := \gamma_c \cdot t_{base} \cdot L_{toe} \cdot b = 8.81 \cdot kN$$

Moment about stem base

$$M_{c\_toe} := W_{c\_toe} \cdot \left(\frac{1}{2} \cdot L_{toe}\right) = 3.3 \cdot kN \cdot m$$

13.2.5 Weight of Soil on Toe

Weight of Soil on Toe

$$W_{s\_toe} := W_{soil\_t} = 2.54 \cdot kN$$

Moment about stem base

$$M_{s\_toe} := W_{s\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 1 \cdot kN \cdot m$$

13.2.6 Weight of Water on Toe

Weight of Water on Toe

$$W_{w\_toe} := W_{w\_t} = 2.45 \cdot kN$$

Moment about stem base

$$M_{w\_toe} := W_{w\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 0.9 \cdot kN \cdot m$$

13.2.7 Bearing Pressures on Footing

Approx. Base in Compression $l_{comp.s} = 3.58\,m$

Effective base pressure at Toe $q_t = 105.30 \cdot kPa$

Effective base pressure at Heel $q_h = 2.73 \cdot kPa$

Compression length under Toe $L_{bearing\_t} := \dfrac{L_{toe}}{\cos(\alpha)} = 0.83\,m$

Compression length under Heel $L_{bearing\_h} := l_{comp.s} - \dfrac{(x_G - x_E)}{\cos(\alpha)} = 2.2\,m$

Bearing pressure under toe side of stem $q_{t1} := L_{bearing\_t} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 81.63 \cdot kPa$

Bearing pressure under heel side of stem $q_{h1} := \dfrac{(x_G - x_E)}{\cos(\alpha)} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 65.85 \cdot kPa$

13.2.8 Soil Reaction on Heel

Soil reaction load on Heel $P_{bearing\_h} := \dfrac{1}{2} \cdot (q_h + q_{h1}) \cdot L_{bearing\_h} \cdot b = 75.53 \cdot kN$

Resultant location $x_{bearing\_h} := \dfrac{L_{bearing\_h}}{2} + \dfrac{L_{bearing\_h}}{6} \cdot \dfrac{(q_h - q_{h1})}{q_{h1} + q_h} = 0.76\,m$

Vertical Component $P_{h\_v} := P_{bearing\_h} \cdot \cos(\alpha) = 68.58 \cdot kN$

Horizontal Component $P_{h\_h} := P_{bearing\_h} \cdot \sin(\alpha) = 31.65 \cdot kN$

Horizontal Moment Arm $x_{h\_h} := x_{bearing\_h} \cdot \cos(\alpha) = 0.69\,m$

Vertical Moment Arm $y_{h\_v} := \left[\dfrac{(x_G - x_E)}{\cos(\alpha)} + x_{bearing\_h}\right] \cdot \sin(\alpha) = 0.9\,m$

Moment on Heel $M_{bearing\_h} := P_{h\_v} \cdot x_{h\_h} + P_{h\_h} \cdot y_{h\_v} = 75.92 \cdot kN \cdot m$

13.2.9 Soil Reaction on Toe

Soil reaction load on Toe $P_{bearing\_t} := \frac{1}{2} \cdot (q_t + q_{t1}) \cdot L_{bearing\_t} \cdot b = 77.21 \cdot kN$

Resultant location $x_{bearing\_t} := \frac{L_{bearing\_t}}{2} + \frac{L_{bearing\_t}}{6} \cdot \frac{(q_t - q_{t1})}{q_t + q_{t1}} = 0.43\,m$

Vertical Component $P_{t\_v} := P_{bearing\_t} \cdot \cos(\alpha) = 70.1 \cdot kN$

Horizontal Component $P_{t\_h} := P_{bearing\_t} \cdot \sin(\alpha) = 32.35 \cdot kN$

Horizontal Moment Arm $x_{t\_h} := x_{bearing\_t} \cdot \cos(\alpha) = 0.39\,m$

Vertical Moment Arm $y_{t\_v} := (L_{bearing\_t} - x_{bearing\_t}) \cdot \sin(\alpha) = 0.17\,m$

Moment on Toe $M_{bearing\_t} := P_{t\_v} \cdot x_{t\_h} + P_{t\_h} \cdot y_{t\_v} = 32.76 \cdot kN \cdot m$

13.2.10 Uplift Pressure on Footing - Figure 6

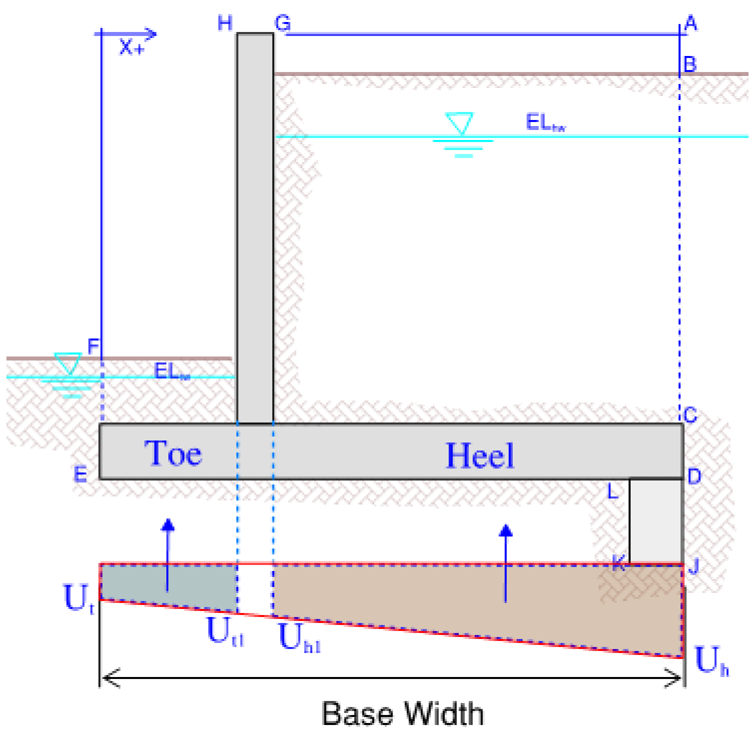

Figure 6 - Uplift Loads on Base (Heel & Toe)

Uplift pressure under toe side of stem $u_{t1} := L_{toe} \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 17.04 \cdot kPa$

Uplift pressure under heel side of stem $u_{h1} := (x_G - x_E) \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 22.95 \cdot kPa$

13.2.11 Uplift Loads Heel

Uplift load on Heel $P_{u\_h} := \frac{1}{2} \cdot (u_h + u_{h1}) \cdot L_{heel} \cdot b = 69.55 \cdot kN$

Moment Arm $x_{u\_h} := \frac{L_{heel}}{2} + \frac{L_{heel}}{6} \cdot \frac{(u_h - u_{h1})}{u_{h1} + u_h} = 1.11\ m$

Moment on Heel $M_{u\_h} := P_{u\_h} \cdot x_{u\_h} = 77.43 \cdot kN \cdot m$

13.2.12 Uplift Loads Toe

Uplift load on Toe $P_{u\_t} := \frac{1}{2} \cdot (u_t + u_{t1}) \cdot L_{toe} \cdot b = 9.45 \cdot kN$

Moment Arm $x_{u\_t} := \frac{L_{toe}}{2} + \frac{L_{toe}}{6} \cdot \frac{(u_t - u_{t1})}{u_{t1} + u_t} = 0.33\ m$

Moment on Toe $M_{u\_t} := P_{u\_t} \cdot x_{u\_t} = 3.13 \cdot kN \cdot m$

13.3 Structural Load Summary

Net shear at stem base $V_{stem} := P_{hw\_stem} - P_{tw\_stem} + P_{s\_h} - P_{s\_t} + P_{sur\_stem} = 59.1 \cdot kN$

Net moment at stem base $M_{stem} := M_{hw\_stem} - M_{tw\_stem} + M_{s\_h} - M_{s\_t} + M_{sur\_stem} = 54.9 \cdot kN \cdot m$

Net shear on Toe $V_t := W_{c\_toe} + W_{s\_toe} + W_{w\_toe} - P_{t\_v} - P_{u\_t} = -65.7 \cdot kN$

Net moment on Toe $M_t := M_{c\_toe} + M_{s\_toe} + M_{w\_toe} - M_{bearing\_t} - M_{u\_t} = -30.7 \cdot kN \cdot m$

Net shear on Heel $V_h := W_{c\_heel} + W_{s\_heel} + W_{w\_heel} - P_{h\_v} - P_{u\_h} = 11.2 \cdot kN$

Net moment on Heel $M_h := M_{c\_heel} + M_{s\_heel} + M_{w\_heel} - M_{bearing\_h} - M_{u\_h} = 8.3 \cdot kN \cdot m$

13.4 Controlling Structural Loads (Unfactored)

Stem cross section

$M_{stem} = 54.9 \cdot kN \cdot m$

$V_{stem} = 59.1 \cdot kN$

Toe cross section

$M_{toe} := M_t = -30.71 \cdot kN \cdot m$

$V_{toe} := V_t = -65.7 \cdot kN$

Heel cross section

$M_{heel} := \min\left(\max\left(M_{stem} - \left|M_{toe}\right|, M_h\right), M_{stem}\right) = 24.1 \cdot kN \cdot m$

STABILITY ANALYSIS FOR CANTILEVER WALL WITH KEY

Project / Client: Springbank Off-Stream Storage (SR1) / Alberta Transportation

Section Location: Intake Structure Wing Wall - End of Wingwall

1.0 OBJECTIVE

For a particular load condition, analyze a reinforced concrete cantilever wall with shear key for overturning, sliding, flotation, and bearing capacity in accordance with criteria described in the listed references.

2.0 BACKGROUND INFORMATION

2.1 DATA SOURCES

1- Soils Report - Recommended Geotechnical Soil Parameters, SR-1 Low Level Outlet (LLO) Structures. July 19, 2019

2- Drawings - Design Drawings

3- Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM) , 2019

3.0 DESIGN PARAMETERS AND CRITERIA

3.1 Stability Analysis Criteria (Data source 2)

Load Case	$LC := 3$
Load Case Description	$\text{vlookup}(LC, CASES, 1)_0 = \text{"Rapid Drawdown"}$
Sliding Minimum Factor of Safety	$FS_{Sliding} := \text{vlookup}(LC, CASES, 2)_0 = 1.1$
Overturning Criteria	$Base\_Comp_{Req} := \text{vlookup}(LC, CASES, 3)_0 = 75 \cdot \%$
Bearing Capacity Minimum Factor of Safety	$FS_{Bearing} := \text{vlookup}(LC, CASES, 4)_0 = 1$
Flotation Minimum Factor of Safety	$FS_{float} := \text{vlookup}(LC, CASES, 5)_0 = 1.1$

3.2 Material Properties - Data Source 1 Unless Otherwise Noted

Unit Weight of Water	$\gamma_w := 9.81 \frac{kN}{m^3}$	
Unit Weight of Concrete	$\gamma_c := 23.5 \cdot \frac{kN}{m^3}$	Data Source 3
Unit Weight of Soil (Moist)	$\gamma_{soilm} := 20 \frac{kN}{m^3}$	
Soil Unit Weight Beneath Base (Saturated)	$\gamma_{soilsat} := 20 \frac{kN}{m^3}$	
Soil Cohesion - Drained	$c_{soil} := 0kPa$	
Soil Angle of Internal Friction - Drained	$\phi_{soil} := 24deg$	
Soil Ultimate Bearing Pressure	$Q_b := 150kPa$	
Slope of backfill (Conservative)	$\beta := 0$	
At-rest lateral earth pressure coefficient	$k_o := 1 - \sin(\phi_{soil}) = 0.59$	

4.0 WALL SECTION DESCRIPTION

4.1 Point Locations (Refer to Figure 1 and Drawings)

A - Top of wall	$EL_A := 1189.9m$	$x_A := 3.25m$
B - Top of fill - reservoir side	$EL_B := 1189.75m$	$x_B := x_A = 3.25 \cdot m$
C - Top of Heel	$EL_C := 1187m$	$x_C := x_A = 3.25 \cdot m$
D - Heel side end of footing	$EL_D := EL_C - 500mm = 1186.50\ m$	$x_D := x_A = 3.25 \cdot m$
E - Toe side end of footing	$EL_E := EL_D = 1186.50 \cdot m$	$x_E := 0m$
F - Top of Fill - land side	$EL_F := EL_C + 2.417m = 1189.42 \cdot m$	$x_F := x_E = 0$
G - Heel side face of wall stem	$EL_G := EL_A = 1189.90 \cdot m$	$x_G := 1.25m$
H - Toe side face of wall stem	$EL_H := EL_A = 1189.90 \cdot m$	$x_H := x_G - 0.500m = 0.75 \cdot m$

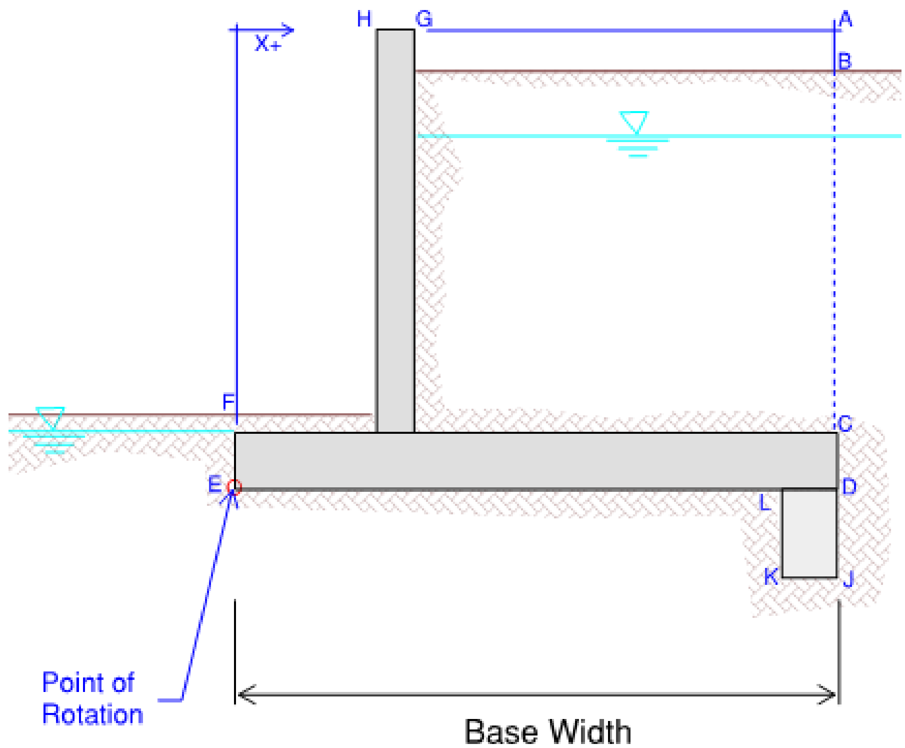

Figure 1. Cantilever Wall Section

J - Bottom of key - heel side	$EL_J := EL_C - 0.95m = 1186.05 \cdot m$	$x_J := x_D = 3.25\ m$
K - Bottom of key - toe side	$EL_K := EL_J = 1186.05 \cdot m$	$x_K := x_J - 450mm = 2.8 \cdot m$
L - Top of key	$EL_L := EL_D = 1186.50 \cdot m$	$x_L := x_K = 2.8\ m$

Applied Loads Data Source 2

Heel side water elevation

$$EL_{hw} := \begin{cases} EL_B & \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 1)_0 \cdot 1m\right) & \text{otherwise} \end{cases} = 1189.75$$

Toe side water elevation

$$EL_{tw} := \begin{cases} EL_F & \text{if } LC = 3 \\ \left(\text{vlookup}(LC, WaterEL, 2)_0 \cdot 1m\right) & \text{otherwise} \end{cases} = 1189.42$$

Equivalent soil surcharge:

$$h_{sur} := \begin{cases} 1.0m & \text{if } LC = 2 \\ 0 & \text{otherwise} \end{cases} = 0 \cdot m$$

4.2 Additional Analysis Dimensions

Analysis Width $b := 1m$

Length of base $L_{base} := x_D - x_E = 3.25 \cdot m$

Thickness of base $t_{base} := EL_C - EL_D = 500 \cdot mm$

Length of stem $L_{stem} := EL_A - EL_C = 2.9 \cdot m$

Thickness of stem $t_{stem} := x_G - x_H = 500 \cdot mm$

Length of Heel $L_{heel} := x_A - x_G = 2000 \cdot mm$

Length of Toe $L_{toe} := x_H - x_F = 750 \cdot mm$

Thickness of Key $t_{key} := x_J - x_K = 450 \cdot mm$

Height of Key $h_{key} := EL_D - EL_J = 450 \cdot mm$

5.0 UPLIFT & HYDROSTATIC LOADS

5.1 Uplift Pressures for Stability Analyses

Determine water pressures for designated coordinates using full headwater uplift pressure at the heel and full tailwater uplift pressure at the toe. Uplift distribution is assumed linear from heel to toe.

Hydrostatic pressure at Heel $u_h := \gamma_w \cdot \left(EL_{hw} - EL_J\right) = 36 \cdot kPa$

Hydrostatic pressure at Toe $u_t := \gamma_w \cdot \left(EL_{tw} - EL_E\right) = 29 \cdot kPa$

Total uplift loads on base $P_u := \frac{\left(u_h + u_t\right)}{2} \cdot L_{base} \cdot b = 105.48 \cdot kN$

Uplift resultant location $x_u := \frac{L_{base}}{2} + \frac{L_{base}}{6} \cdot \frac{\left(u_h - u_t\right)}{u_t + u_h} = 1.69 \cdot m$

Uplift Moment about Toe $M_u := P_u \cdot x_u = 178.2 \cdot kN \cdot m$

5.2 Headwater Hydrostatic Load - Heel Side

Headwater hydrostatic load $P_{hw} := \frac{1}{2} u_h \cdot (EL_{hw} - EL_J) \cdot b = 67.1 \cdot kN$

Headwater moment arm $y_{hw} := \frac{1}{3}(EL_{hw} - EL_J) - h_{key} = 0.78 \cdot m$

Headwater Moment about Toe $M_{hw} := P_{hw} \cdot y_{hw} = 52.6 \cdot kN \cdot m$

5.3 Tailwater Hydrostatic Load - Toe Side

Tailwater hydrostatic load $P_{tw} := \frac{1}{2} \gamma_w \cdot (EL_{tw} - EL_K)^2 \cdot b = 55.61 \cdot kN$

Tailwater moment arm $y_{tw} := h_{key} - \frac{1}{3}(EL_{tw} - EL_K) = -0.67 \cdot m$

Tailwater Moment about Toe $M_{tw} := P_{tw} \cdot y_{tw} = -37.39 \cdot kN \cdot m$

6.0 LATERAL EARTH PRESSURE

6.1 Lateral Soil Load on Toe Side

Soil pressure at Saturation Level

$$p_{tw} := \left| \begin{array}{l} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) \ \text{ if } EL_F > EL_{tw} \\ 0psf \ \text{ otherwise} \end{array} \right. = 0.0 \cdot kPa$$

Soil pressure at Toe - base elevation

$$p_E := \left| \begin{array}{l} p_{tw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_J) \ \text{ if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_J) \ \text{ otherwise} \end{array} \right.$$

$p_E = 20.35 \cdot kPa$

Total soil loads on Wall

$$P_{soil\_t} := \begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} + p_{tw} \cdot (EL_{tw} - EL_J) \ ... \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J) \end{bmatrix} \cdot b = 34.27 \cdot kN$$

Resultant location

$$y_{soil\_t} := \left| \begin{array}{l} 0 \ \text{ if } P_{soil\_t} = 0 \\ h_{key} - \dfrac{\begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} \left[(EL_{tw} - EL_J) + \frac{1}{3}(EL_F - EL_{tw}) \right] + p_{tw} \cdot \frac{1}{2}(EL_{tw} - EL_J)^2 \ ... \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)^2 \cdot \frac{1}{3} \end{bmatrix} \cdot b}{P_{soil\_t}} \ \text{ otherwise} \end{array} \right.$$

$y_{soil\_t} = -0.67 \cdot m$

Moment about Toe $M_{soil\_t} := P_{soil\_t} \cdot y_{soil\_t} = -23.04 \cdot kN \cdot m$

6.2 Lateral Soil Load on Heel Side

Soil pressure at Saturation Level

$$p_{hw} := \begin{vmatrix} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) \text{ if } EL_B > EL_{hw} \\ 0psf \text{ otherwise} \end{vmatrix} = 0.0 \cdot kPa$$

Soil pressure at Heel - base elevation

$$p_D := \begin{vmatrix} p_{hw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_J) \text{ if } EL_B > EL_{hw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_J) \text{ otherwise} \end{vmatrix}$$

$$p_D = 22.37 \cdot kPa$$

Total soil loads on Base

$$P_{soil\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} + p_{hw} \cdot (EL_{hw} - EL_J) \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)\right] \cdot b$$

$$P_{soil\_h} = 41.38 \cdot kN$$

Resultant location

$$y_{soil\_h} := \frac{\left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} \cdot \left[EL_{hw} - EL_J + \frac{1}{3}(EL_B - EL_{hw})\right] + p_{hw} \cdot \frac{1}{2}(EL_{hw} - EL_J)^2 \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{soil\_h}} - h_{key}$$

$$y_{soil\_h} = 0.78 \cdot m$$

Moment about Toe $M_{soil\_h} := P_{soil\_h} \cdot y_{soil\_h} = 32.4 \cdot kN \cdot m$

6.3 Surcharge Soil Load - Heel Side

Surcharge soil pressure $p_{sur} := k_o \cdot \gamma_{soilm} \cdot h_{sur} = 0 \cdot kPa$

Soil load on wall $P_{sur} := p_{sur} \cdot (EL_B - EL_J) \cdot b = 0 \cdot kN$

Resultant location $y_{sur} := \frac{1}{2} \cdot (EL_B - EL_J) - h_{key} = 1.4\,m$

Moment about Toe $M_{sur} := P_{sur} \cdot y_{sur} = 0 \cdot kN \cdot m$

7.0 GRAVITY LOADS

7.1 Weight of Concrete

Weight of Wall footing/base $W_{conc} := \gamma_c \cdot (t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}) \cdot b = 77.02 \cdot kN$

Resultant location
$$x_{conc} := \frac{\left[\frac{1}{2} t_{base} \cdot L_{base}^{\ 2} + L_{stem} \cdot t_{stem} \cdot (L_{toe} + 0.5 t_{stem}) \ldots \atop + t_{key} \cdot h_{key} \cdot (L_{base} - 0.5 t_{key})\right]}{t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}} = 1.43\ m$$

Moment about Toe $M_{conc} := W_{conc} \cdot x_{conc} = 110.52 \cdot kN \cdot m$

7.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{soil\_h} := b \cdot L_{heel} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{if } EL_B < EL_{hw} \\ \gamma_{soilm} \cdot (EL_B - EL_{hw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max[0, (EL_{hw} - EL_C)] & \text{otherwise} \end{array} \right.$$

$W_{soil\_h} = 56.05 \cdot kN$

Resultant location $x_{soil\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{soilw\_h} := W_{soil\_h} \cdot x_{soil\_h} = 126.1 \cdot kN \cdot m$

7.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_h} := \gamma_w \cdot \max[0kip, (EL_{hw} - EL_C)] \cdot L_{heel} \cdot b = 53.95 \cdot kN$

Resultant location $x_{w\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{w\_h} := W_{w\_h} \cdot x_{w\_h} = 121.4 \cdot kN \cdot m$

7.4 Weight of Soil on Toe

Weight of Soil on toe Note: Water and soil elevations MUST NOT be below footing elevation

$$W_{soil\_t} := b \cdot L_{toe} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (\max(0, EL_F - EL_C)) & \text{if } EL_F < EL_{tw} \\ \gamma_{soilm} \cdot \max(0, EL_F - EL_{tw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max(EL_{tw} - EL_C, 0) & \text{otherwise} \end{array} \right.$$

$W_{soil\_t} = 18.47 \cdot kN$

Resultant location $x_{soil\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

Moment about Toe $M_{soilw\_t} := W_{soil\_t} \cdot x_{soil\_t} = 6.9 \cdot kN \cdot m$

7.5 Weight of Water on Toe

Weight of Water on toe $W_{w\_t} := \gamma_w \cdot \max\left[0kip, \left(EL_{tw} - EL_C\right)\right] \cdot L_{toe} \cdot b = 17.78 \cdot kN$

Resultant location $x_{w\_t} := 0.5\left(x_H - x_E\right) = 0.38 \cdot m$

Moment about Toe $M_{w\_t} := W_{w\_t} \cdot x_{w\_t} = 6.7 \cdot kN \cdot m$

7.6 Weight of Soil under Footing and Above Failure Plane EJ

Depth of Soil Wedge Near Key $h_{s\_under} := \left(x_L - x_E\right) \cdot \frac{h_{key}}{L_{base}} = 0.39\,m$

Length of Soil Wedge $L_{s\_under} := x_L - x_E = 2.8\,m$

Weight of Soil Wedge Under Footing $W_{s\_under} := \gamma_{soilsat} \cdot \left(0.5 \cdot h_{s\_under} \cdot L_{s\_under}\right) \cdot b = 10.86 \cdot kN$

Resultant location $x_{s\_under} := \frac{2}{3}\left(x_L - x_E\right) = 1.87 \cdot m$

Moment about Toe $M_{s\_under} := W_{s\_under} \cdot x_{s\_under} = 20.3 \cdot kN \cdot m$

8.0 Overturning Stability Assessment - See Figure 2

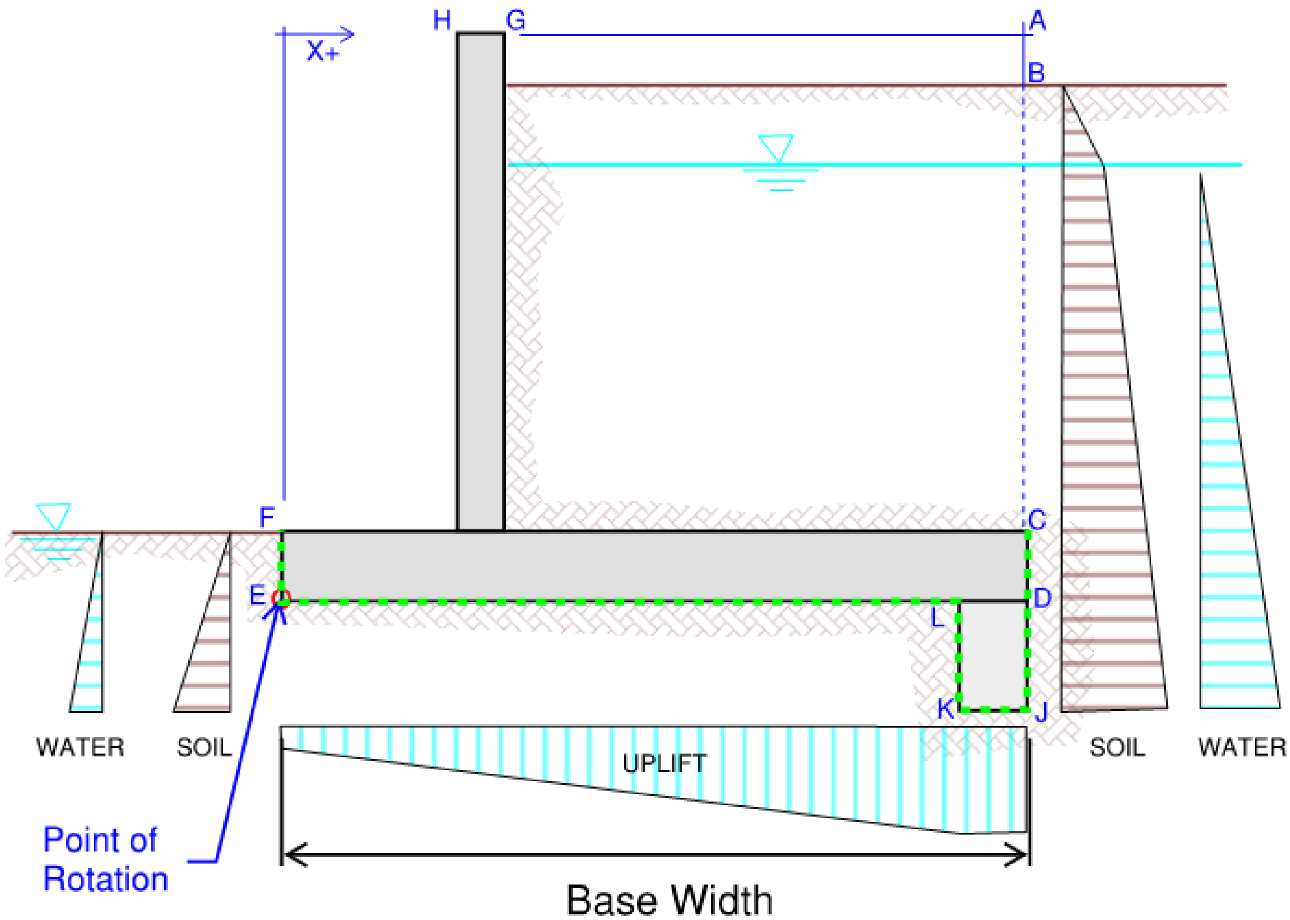

Figure 2. Free Body Diagram for Overturning Analysis

Uplift loads for Overturning

$$P_{u\_ot} := \left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]\cdot b = 107.21\cdot kN$$

Uplift resultant location

$$x_{u\_ot} := \frac{\left[\left[\frac{x_L - x_E}{2} + \frac{x_L - x_E}{6}\cdot\frac{\left(u_h - u_t\right)}{u_t + u_h}\right]\cdot\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right)\right] \ldots + \left(L_{base} - 0.5t_{key}\right)\cdot\left(u_h\cdot t_{key}\right)\right]}{\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]}$$

$$x_{u\_ot} = 1.69\,m$$

Uplift Moment about Toe

$$M_{u\_ot} := P_{u\_ot}\cdot x_{u\_ot} = 181.7\cdot kN\cdot m$$

Total Vertical Forces
$$\Sigma V_{ot} := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t} - P_{u\_ot} = 116.1 \cdot kN$$

Total Horizontal Forces
$$\Sigma H_{ot} := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 18.66 \cdot kN$$

Total Resisting Moments
$$\Sigma M_{r\_ot} := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} = 371.6 \cdot kN \cdot m$$

Total Driving Moments
$$\Sigma M_{d\_ot} := M_{hw} + M_{soil\_h} + M_{sur} + M_{u\_ot} \cdots + M_{tw} + M_{soil\_t} = 206.2 \cdot kN \cdot m$$

Resultant Location from Toe
$$x_{r\_ot} := \frac{\Sigma M_{r\_ot} - \Sigma M_{d\_ot}}{\Sigma V_{ot}} = 1.42 \cdot m$$

Normalized Resultant Location
$$\frac{x_{r\_ot}}{L_{base}} = 0.438$$

Eccentricity
$$e_{x\_ot} := \frac{L_{base}}{2} - x_{r\_ot} = 0.2 \cdot m$$

Approx. Base in Compression
$$l_{comp\_ot} := \min\left[L_{base}, \frac{3}{2} \cdot \left(L_{base} - 2 \cdot e_{x\_ot}\right)\right] = 3.25 \cdot m$$

Percent Base in Compression
$$\boxed{Base\_Comp := \left(\frac{l_{comp\_ot}}{L_{base}}\right) = 100 \cdot \%}$$

Resultant Location Check
$$check_{res} := if\left(Base\_Comp \geq Base\_Comp_{Req}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$$

9.0 Flotation Stability Assessment - See Figure 2

Calculated Flotation Safety Factor
$$\boxed{FS_f := \frac{W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}}{P_{u\_ot}} = 2.1}$$

Flotation Stability Check
$$check_{floatation} := if\left(FS_f \geq FS_{float}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$$

10.0 Sliding Stability Assessment - See Figure 3

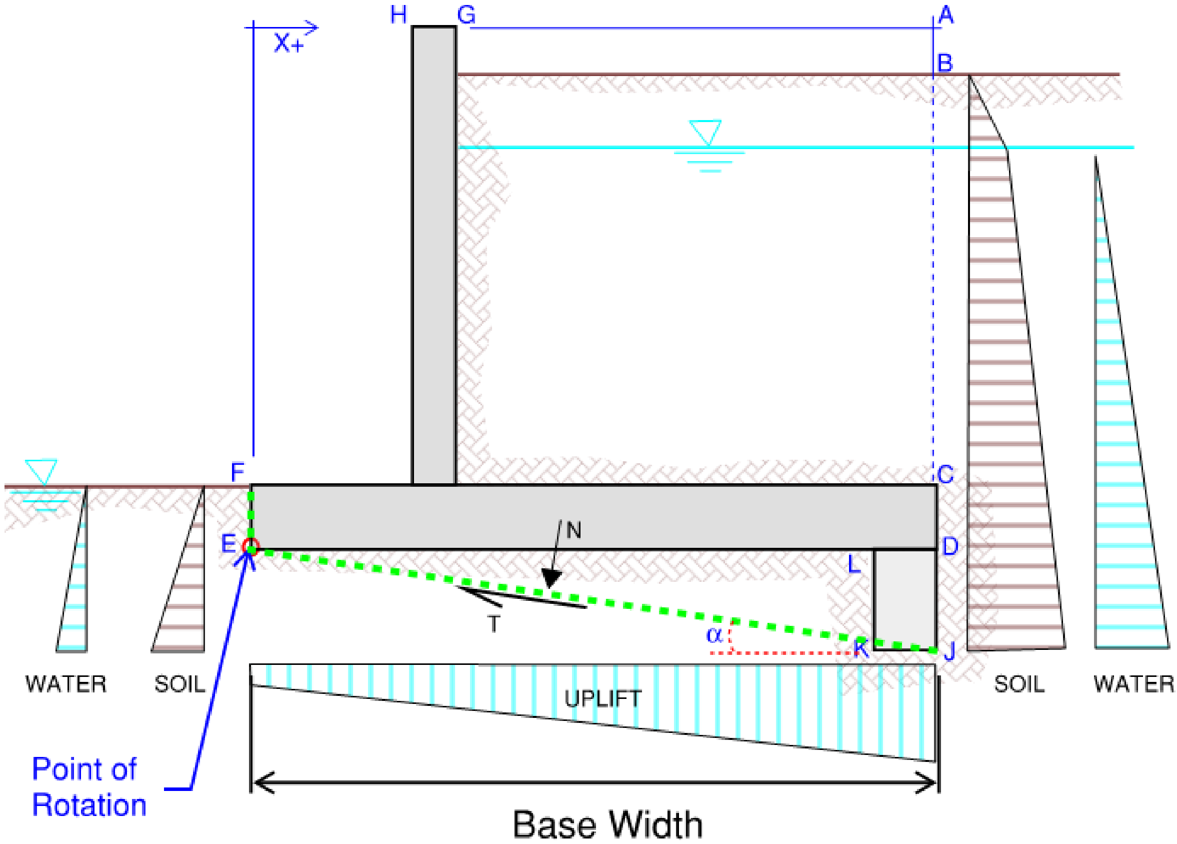

Figure 3. Free Body Diagram for Sliding Analysis

Length of Sliding Failure Plane, EJ

$$L_{fp} := \sqrt{L_{base}^{2} + h_{key}^{2}} = 3.28\,m$$

Angle of Sliding Failure Plane From Horizontal

$$\alpha := \operatorname{atan}\left(\frac{h_{key}}{L_{base}}\right) = 7.9 \cdot deg$$

Total Vertical Forces

$$\Sigma V := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{s\_under} + W_{w\_t} - P_u = 128.6 \cdot kN$$

Total Horizontal Forces

$$\Sigma H := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 18.66 \cdot kN$$

Total Resisting Moments

$$\Sigma M_r := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} + M_{s\_under} = 391.9\,m \cdot kN$$

Total Driving Moments

$$\Sigma M_d := M_{hw} + M_{soil\_h} + M_{sur} + M_u \cdots + M_{tw} + M_{soil\_t} = 202.8 \cdot kN \cdot m$$

Normal Force on Sliding Failure Plane: $N_s := \Sigma H \cdot \sin(\alpha) + \Sigma V \cdot \cos(\alpha) = 129.99 \cdot kN$

Tangential Force on Sliding Failure Plane: $T_s := \Sigma H \cdot \cos(\alpha) - \Sigma V \cdot \sin(\alpha) = 0.84 \cdot kN$

Calculated Sliding Safety Factor $\boxed{FS_s := \frac{\left|N_s \cdot \tan\left(0.95\phi_{soil}\right)\right|}{\left|T_s\right|} = 65.40}$

Sliding Stability Check $check_{sliding} := if\left(FS_s \geq FS_{Sliding}, "OK", "NG"\right) = "OK"$

11.0 Bearing Capacity Assessment

Resultant Location from Toe $x_r := \frac{\Sigma M_r - \Sigma M_d}{N_s} = 1.45 \cdot m$

Eccentricity of N_s from center of base $e_s := \frac{L_{fp}}{2} - x_r = 0.19 \cdot m$

Approx. Base in Compression $l_{comp.s} := \min\left[L_{fp}, \frac{3}{2} \cdot \left(L_{fp} - 2 \cdot e_s\right)\right] = 3.28 \cdot m$

Updated Eccentricity $e_x := \frac{l_{comp.s} - L_{fp}}{2} + e_s = 0.19 \cdot m$

Effective base pressure at Toe $q_t := \left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 + \frac{6 \cdot e_x}{l_{comp.s}}\right) = 53.07 \cdot kPa$

Effective base pressure at Heel $q_h := \max\left[\left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 - \frac{6 \cdot e_x}{l_{comp.s}}\right), 0\right] = 26.17 \cdot kPa$

Calculated Bearing Safety Factor $\boxed{FS_b := \frac{Q_b}{\max\left(q_t, q_h\right)} = 2.83}$

Bearing Pressure Check $check_{bearing} := if\left(FS_b \geq FS_{Bearing}, "OK", "NG"\right) = "OK"$

12.0 Summary of Stability Assessments

Base Compression / Resultant Location	$Base\_Comp = 100 \cdot \%$	$check_{res} = "OK"$
Flotation Stability	$FS_f = 2.1$	$check_{floatation} = "OK"$
Sliding Stability	$FS_s = 65.4$	$check_{sliding} = "OK"$
Bearing Pressure	$FS_b = 2.8$	$check_{bearing} = "OK"$

13.0 Structural Loads

13.1 Shear and Moment at Stem Base - See Figure 4

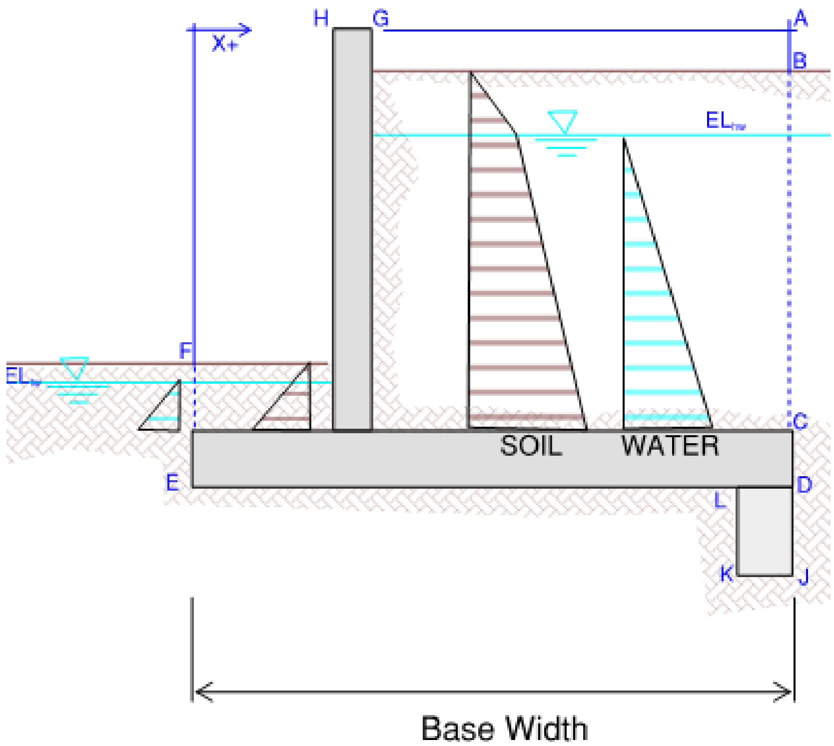

Figure 4 - Loads on Stem

13.1.1 Hydrostatic Load at Stem Base

Heel side hydrostatic load $$P_{hw\_stem} := \frac{1}{2}\gamma_w \cdot \left(EL_{hw} - EL_C\right)^2 \cdot b = 37.1 \cdot kN$$

Heel side moment at stem base $$M_{hw\_stem} := P_{hw\_stem} \cdot \left(\frac{EL_{hw} - EL_C}{3}\right) = 34 \cdot kN \cdot m$$

Toe side hydrostatic load $$P_{tw\_stem} := \frac{1}{2}\gamma_w \cdot \left(EL_{tw} - EL_C\right)^2 \cdot b = 28.7 \cdot kN$$

Toe side moment at stem base $$M_{tw\_stem} := P_{tw\_stem} \cdot \left(\frac{EL_{tw} - EL_C}{3}\right) = 23.1 \cdot kN \cdot m$$

13.1.2 Lateral Soil Loads at Stem Base

Soil pressure at saturation level - Toe Side

$$p_t := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 0.00 \cdot kPa$$

Soil pressure at stem base - Toe Side

$$p_{C.t} := \begin{cases} p_t + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_C) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.t} = 14.61 \cdot kPa$$

Lateral soil loads at stem base - Toe Side

$$P_{s\_t} := \left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t + p_t \cdot (EL_{tw} - EL_C) \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)\right] \cdot b = 17.66 \cdot kN$$

Resultant location

$$y_{s\_t} := \begin{cases} 0 & \text{if } P_{s\_t} = 0 \\ \dfrac{\left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t \cdot \left[(EL_{tw} - EL_C) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_t \cdot \frac{1}{2}(EL_{tw} - EL_C)^2 \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{s\_t}} & \text{otherwise} \end{cases}$$

$$y_{s\_t} = 0.81 \cdot m$$

Lateral soil moment at stem base - Toe Side

$$M_{s\_t} := P_{s\_t} \cdot y_{s\_t} = 14.23 \cdot kN \cdot m$$

Soil pressure at saturation level - Heel Side

$$p_h := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0kPa & \text{otherwise} \end{cases} = 0.00 \cdot kPa$$

Soil pressure at stem base - Heel Side

$$p_{C.h} := \begin{cases} p_h + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_C) & \text{if } EL_B > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.h} = 16.62 \cdot kPa$$

Lateral soil loads at stem base - Heel Side

$$P_{s\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_h + p_h \cdot (EL_{hw} - EL_C) \ldots + 0.5 \cdot (p_{C.h} - p_h) \cdot (EL_{hw} - EL_C)\right] \cdot b = 22.86 \cdot kN$$

Resultant location

$$y_{s\_h} := \begin{cases} 0 & \text{if } P_{s\_h} = 0 \\ \dfrac{\left[0.5\cdot(EL_B - EL_{hw})\cdot p_h\cdot\left[(EL_{hw} - EL_C) + \frac{1}{3}(EL_B - EL_{hw})\right] + p_h\cdot\frac{1}{2}(EL_{hw} - EL_C)^2 \ldots + 0.5\cdot(p_{C.h} - p_h)\cdot(EL_{hw} - EL_C)^2\cdot\frac{1}{3}\right]\cdot b}{P_{s\_h}} & \text{otherwise} \end{cases}$$

$$y_{s\_h} = 0.92\cdot m$$

Lateral soil moment at stem base - Heel Side $\qquad M_{s\_h} := P_{s\_h}\cdot y_{s\_h} = 20.95\cdot kN\cdot m$

13.1.3 Surcharge Loads at Stem Base

Surcharge load at stem base $\qquad P_{sur\_stem} := p_{sur}\cdot(EL_B - EL_C)\cdot b = 0\cdot kN$

Surcharge Moment about Toe $\qquad M_{sur\_stem} := P_{sur}\cdot\frac{1}{2}(EL_B - EL_C) = 0\cdot kN\cdot m$

13.2 Shear and Moment on Heel - See Figure 5

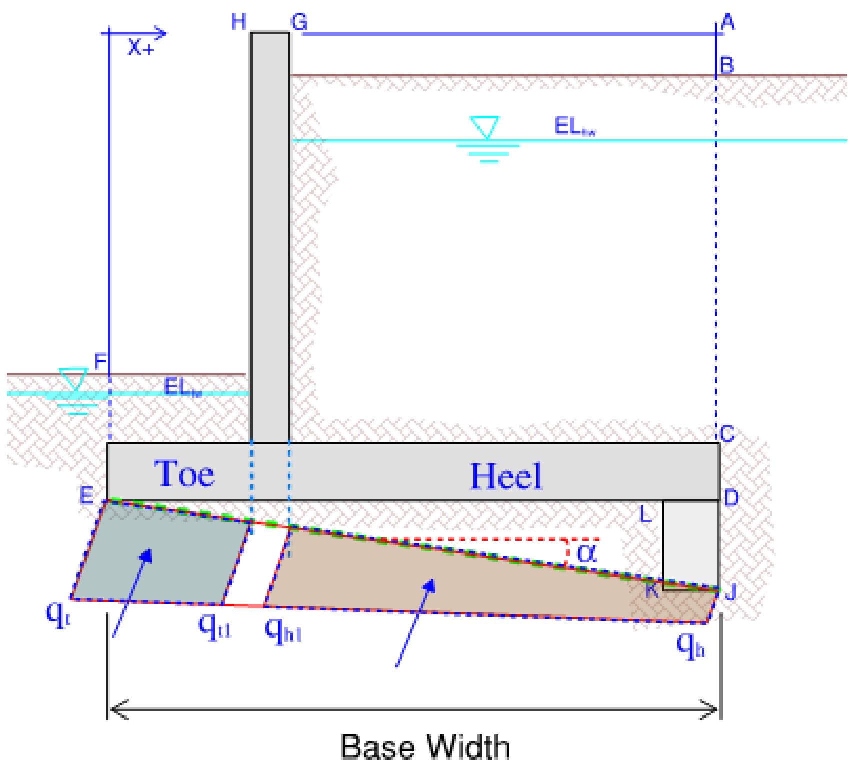

Figure 5 - Loads on Base (Heel & Toe)

13.2.1 Weight of Concrete Heel

Weight of Wall footing/base

$$W_{c\_heel} := \gamma_c \cdot (t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}) \cdot b = 28.26 \cdot kN$$

Resultant location

$$x_{c\_heel} := \frac{\left[\frac{1}{2} t_{base} \cdot L_{heel}^{2} \ldots + t_{key} \cdot h_{key} \cdot (L_{heel} - 0.5 t_{key})\right]}{t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}} = 1.13\ m$$

Moment about stem base

$$M_{c\_heel} := W_{c\_heel} \cdot x_{c\_heel} = 31.95 \cdot kN \cdot m$$

13.2.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{s\_heel} := W_{soil\_h} = 56.05 \cdot kN$$

Moment about stem base

$$M_{s\_heel} := W_{s\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 56 \cdot kN \cdot m$$

13.2.3 Weight of Water on Heel

Weight of Water on heel

$$W_{w\_heel} := W_{w\_h} = 53.95 \cdot kN$$

Moment about stem base

$$M_{w\_heel} := W_{w\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 54 \cdot kN \cdot m$$

13.2.4 Weight of Concrete Toe

Weight of Wall footing/base

$$W_{c\_toe} := \gamma_c \cdot t_{base} \cdot L_{toe} \cdot b = 8.81 \cdot kN$$

Moment about stem base

$$M_{c\_toe} := W_{c\_toe} \cdot \left(\frac{1}{2} \cdot L_{toe}\right) = 3.3 \cdot kN \cdot m$$

13.2.5 Weight of Soil on Toe

Weight of Soil on Toe

$$W_{s\_toe} := W_{soil\_t} = 18.47 \cdot kN$$

Moment about stem base

$$M_{s\_toe} := W_{s\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 6.9 \cdot kN \cdot m$$

13.2.6 Weight of Water on Toe

Weight of Water on Toe

$$W_{w\_toe} := W_{w\_t} = 17.78 \cdot kN$$

Moment about stem base

$$M_{w\_toe} := W_{w\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 6.7 \cdot kN \cdot m$$

13.2.7 Bearing Pressures on Footing

Approx. Base in Compression $l_{comp.s} = 3.28\,m$

Effective base pressure at Toe $q_t = 53.07 \cdot kPa$

Effective base pressure at Heel $q_h = 26.17 \cdot kPa$

Compression length under Toe $L_{bearing\_t} := \dfrac{L_{toe}}{\cos(\alpha)} = 0.76\,m$

Compression length under Heel $L_{bearing\_h} := l_{comp.s} - \dfrac{(x_G - x_E)}{\cos(\alpha)} = 2.02\,m$

Bearing pressure under toe side of stem $q_{t1} := L_{bearing\_t} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 46.86 \cdot kPa$

Bearing pressure under heel side of stem $q_{h1} := \dfrac{(x_G - x_E)}{\cos(\alpha)} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 42.72 \cdot kPa$

13.2.8 Soil Reaction on Heel

Soil reaction load on Heel $P_{bearing\_h} := \dfrac{1}{2} \cdot (q_h + q_{h1}) \cdot L_{bearing\_h} \cdot b = 69.55 \cdot kN$

Resultant location $x_{bearing\_h} := \dfrac{L_{bearing\_h}}{2} + \dfrac{L_{bearing\_h}}{6} \cdot \dfrac{(q_h - q_{h1})}{q_{h1} + q_h} = 0.93\,m$

Vertical Component $P_{h\_v} := P_{bearing\_h} \cdot \cos(\alpha) = 68.89 \cdot kN$

Horizontal Component $P_{h\_h} := P_{bearing\_h} \cdot \sin(\alpha) = 9.54 \cdot kN$

Horizontal Moment Arm $x_{h\_h} := x_{bearing\_h} \cdot \cos(\alpha) = 0.92\,m$

Vertical Moment Arm $y_{h\_v} := \left[\dfrac{(x_G - x_E)}{\cos(\alpha)} + x_{bearing\_h}\right] \cdot \sin(\alpha) = 0.3\,m$

Moment on Heel $M_{bearing\_h} := P_{h\_v} \cdot x_{h\_h} + P_{h\_h} \cdot y_{h\_v} = 66.24 \cdot kN \cdot m$

13.2.9 Soil Reaction on Toe

Soil reaction load on Toe $P_{bearing\_t} := \frac{1}{2} \cdot (q_t + q_{t1}) \cdot L_{bearing\_t} \cdot b = 37.83 \cdot kN$

Resultant location $x_{bearing\_t} := \frac{L_{bearing\_t}}{2} + \frac{L_{bearing\_t}}{6} \cdot \frac{(q_t - q_{t1})}{q_t + q_{t1}} = 0.39\,m$

Vertical Component $P_{t\_v} := P_{bearing\_t} \cdot \cos(\alpha) = 37.47 \cdot kN$

Horizontal Component $P_{t\_h} := P_{bearing\_t} \cdot \sin(\alpha) = 5.19 \cdot kN$

Horizontal Moment Arm $x_{t\_h} := x_{bearing\_t} \cdot \cos(\alpha) = 0.38\,m$

Vertical Moment Arm $y_{t\_v} := (L_{bearing\_t} - x_{bearing\_t}) \cdot \sin(\alpha) = 0.05\,m$

Moment on Toe $M_{bearing\_t} := P_{t\_v} \cdot x_{t\_h} + P_{t\_h} \cdot y_{t\_v} = 14.61 \cdot kN \cdot m$

13.2.10 Uplift Pressure on Footing - Figure 6

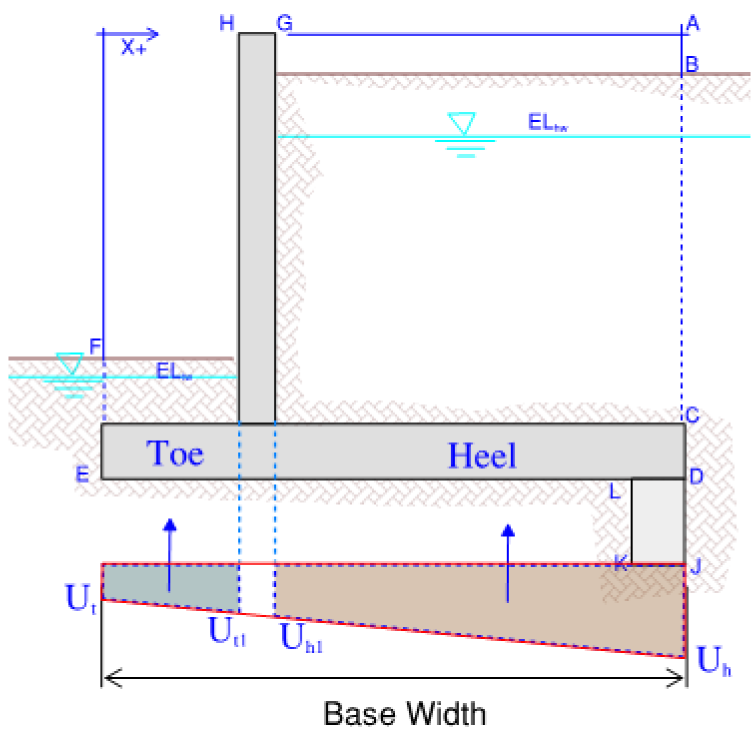

Figure 6 - Uplift Loads on Base (Heel & Toe)

Uplift pressure under toe side of stem $u_{t1} := L_{toe} \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 30.39 \cdot kPa$

Uplift pressure under heel side of stem $u_{h1} := (x_G - x_E) \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 31.57 \cdot kPa$

13.2.11 Uplift Loads Heel

Uplift load on Heel $P_{u\_h} := \frac{1}{2} \cdot (u_h + u_{h1}) \cdot L_{heel} \cdot b = 67.87 \cdot kN$

Moment Arm $x_{u\_h} := \frac{L_{heel}}{2} + \frac{L_{heel}}{6} \cdot \frac{(u_h - u_{h1})}{u_{h1} + u_h} = 1.02\ m$

Moment on Heel $M_{u\_h} := P_{u\_h} \cdot x_{u\_h} = 69.44 \cdot kN \cdot m$

13.2.12 Uplift Loads Toe

Uplift load on Toe $P_{u\_t} := \frac{1}{2} \cdot (u_t + u_{t1}) \cdot L_{toe} \cdot b = 22.13 \cdot kN$

Moment Arm $x_{u\_t} := \frac{L_{toe}}{2} + \frac{L_{toe}}{6} \cdot \frac{(u_t - u_{t1})}{u_{t1} + u_t} = 0.37\ m$

Moment on Toe $M_{u\_t} := P_{u\_t} \cdot x_{u\_t} = 8.21 \cdot kN \cdot m$

13.3 Structural Load Summary

Net shear at stem base $V_{stem} := P_{hw\_stem} - P_{tw\_stem} + P_{s\_h} - P_{s\_t} + P_{sur\_stem} = 13.6 \cdot kN$

Net moment at stem base $M_{stem} := M_{hw\_stem} - M_{tw\_stem} + M_{s\_h} - M_{s\_t} + M_{sur\_stem} = 17.6 \cdot kN \cdot m$

Net shear on Toe $V_t := W_{c\_toe} + W_{s\_toe} + W_{w\_toe} - P_{t\_v} - P_{u\_t} = -14.5 \cdot kN$

Net moment on Toe $M_t := M_{c\_toe} + M_{s\_toe} + M_{w\_toe} - M_{bearing\_t} - M_{u\_t} = -5.9 \cdot kN \cdot m$

Net shear on Heel $V_h := W_{c\_heel} + W_{s\_heel} + W_{w\_heel} - P_{h\_v} - P_{u\_h} = 1.5 \cdot kN$

Net moment on Heel $M_h := M_{c\_heel} + M_{s\_heel} + M_{w\_heel} - M_{bearing\_h} - M_{u\_h} = 6.3 \cdot kN \cdot m$

13.4 Controlling Structural Loads (Unfactored)

Stem cross section

$M_{stem} = 17.6 \cdot kN \cdot m$

$V_{stem} = 13.6 \cdot kN$

Toe cross section

$M_{toe} := M_t = -5.92 \cdot kN \cdot m$

$V_{toe} := V_t = -14.5 \cdot kN$

Heel cross section

$M_{heel} := \min\left(\max\left(M_{stem} - \left|M_{toe}\right|, M_h\right), M_{stem}\right) = 11.7 \cdot kN \cdot m$

STABILITY ANALYSIS FOR CANTILEVER WALL WITH KEY

Project / Client: Springbank Off-Stream Storage (SR1) / Alberta Transportation

Section Location: Intake Structure Wing Wall - Closest to Intake Structure

1.0 OBJECTIVE

For a particular load condition, analyze a reinforced concrete cantilever wall with shear key for overturning, sliding, flotation, and bearing capacity in accordance with criteria described in the listed references.

2.0 BACKGROUND INFORMATION

2.1 DATA SOURCES

1- Soils Report - Recommended Geotechnical Soil Parameters, SR-1 Low Level Outlet (LLO) Structures. July 19, 2019

2- Drawings - Design Drawings

3- Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM) , 2019

2.2 REFERENCES

1. (CDA) Dam Safety Guidelines, 2007 (revised 2013).

2. "Water Control Structures Selected Design Guidelines," Alberta Transportation & Alberta Environment, Calgary Alberta, November 2004.

3.0 DESIGN PARAMETERS AND CRITERIA

3.1 Stability Analysis Criteria (Data source 2)

Load Case	$LC := 4$ $\quad$ $EQ := 3$
Load Case Description	$\text{vlookup}(LC, CASES, 1)_0 = \text{"Earthquake"}$
Sliding Minimum Factor of Safety	$FS_{Sliding} := \text{vlookup}(LC, CASES, 2)_0 = 1$
Overturning Criteria	$Base\_Comp_{Req} := \text{vlookup}(LC, CASES, 3)_0 = 0.1 \cdot \%$
Bearing Capacity Minimum Factor of Safety	$FS_{Bearing} := \text{vlookup}(LC, CASES, 4)_0 = 1$
Flotation Minimum Factor of Safety	$FS_{float} := \text{vlookup}(LC, CASES, 5)_0 = 1$

3.2 Applied Loads

Heel side water elevation $EL_{hw} := \text{vlookup}(LC, WaterEL, 1)_0 \cdot 1m = 1187\,m$ Data Source 2

Toe side water elevation $EL_{tw} := \text{vlookup}(LC, WaterEL, 2)_0 \cdot 1m = 1187\,m$

Equivalent soil surcharge $h_{sur} := \begin{cases} 1.0m & \text{if } LC = 2 \\ 0 & \text{otherwise} \end{cases} = 0 \cdot m$

Horizontal Seismic Coefficient $k_h := \begin{cases} \text{vlookup}(EQ, CASES_{eq}, 1)_0 & \text{if } LC = 4 \\ 0 & \text{otherwise} \end{cases} = 0.19$

Vertical Seismic Coefficient $k_v := \begin{cases} \text{vlookup}(EQ, CASES_{eq}, 2)_0 & \text{if } LC = 4 \\ 0 & \text{otherwise} \end{cases} = -0.03$

3.3 Material Properties - Data Source 1 Unless Otherwise Noted

Unit Weight of Water $\gamma_w := 9.81 \dfrac{kN}{m^3}$

Unit Weight of Concrete $\gamma_c := 23.5 \cdot \dfrac{kN}{m^3}$ Data Source 3

Unit Weight of Soil (Moist) $\gamma_{soilm} := 20 \dfrac{kN}{m^3}$

Soil Unit Weight Beneath Base (Saturated) $\gamma_{soilsat} := 20 \dfrac{kN}{m^3}$

Soil Cohesion - Drained $c_{soil} := 0kPa$

Soil Angle of Internal Friction - Drained $\phi_{soil} := 24deg$

Soil Ultimate Bearing Pressure $Q_b := 450kPa$

Slope of backfill (Conservative) $\beta := 0$

At-rest lateral earth pressure coefficient $k_o := 1 - \sin(\phi_{soil}) = 0.59$

4.0 WALL SECTION DESCRIPTION

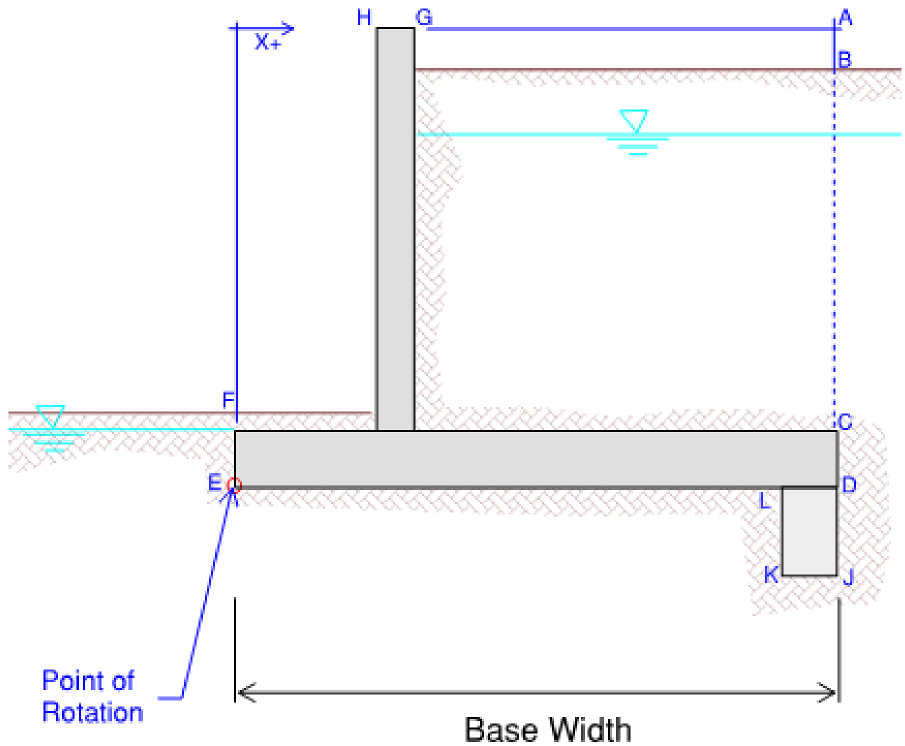

Figure 1. Cantilever Wall Section

4.1 Point Locations (Refer to Figure 1 and Drawings)

A - Top of wall	$EL_A := 1189.9m$	$x_A := 3.25m$
B - Top of fill - reservoir side	$EL_B := 1189.75m$	$x_B := x_A = 3.25 \cdot m$
C - Top of Heel	$EL_C := 1187m$	$x_C := x_A = 3.25 \cdot m$
D - Heel side end of footing	$EL_D := EL_C - 500mm = 1186.50\ m$	$x_D := x_A = 3.25 \cdot m$
E - Toe side end of footing	$EL_E := EL_D = 1186.50 \cdot m$	$x_E := 0m$
F - Top of Fill - land side	$EL_F := EL_C + 333mm = 1187.33 \cdot m$	$x_F := x_E = 0$
G - Heel side face of wall stem	$EL_G := EL_A = 1189.90 \cdot m$	$x_G := 1.25m$
H - Toe side face of wall stem	$EL_H := EL_A = 1189.90 \cdot m$	$x_H := x_G - 0.500m = 0.75 \cdot m$

J - Bottom of key - heel side	$EL_J := EL_C - 2m = 1185.00 \cdot m$	$x_J := x_D = 3.25\ m$
K - Bottom of key - toe side	$EL_K := EL_J = 1185.00 \cdot m$	$x_K := x_J - 450mm = 2.8 \cdot m$
L - Top of key	$EL_L := EL_D = 1186.50 \cdot m$	$x_L := x_K = 2.8\ m$

4.2 Additional Analysis Dimensions

Analysis Width	$b := 1m$
Length of base	$L_{base} := x_D - x_E = 3.25 \cdot m$
Thickness of base	$t_{base} := EL_C - EL_D = 500 \cdot mm$
Length of stem	$L_{stem} := EL_A - EL_C = 2900 \cdot mm$
Thickness of stem	$t_{stem} := x_G - x_H = 500 \cdot mm$
Length of Heel	$L_{heel} := x_A - x_G = 2000 \cdot mm$
Length of Toe	$L_{toe} := x_H - x_F = 750 \cdot mm$
Thickness of Key	$t_{key} := x_J - x_K = 450 \cdot mm$
Height of Key	$h_{key} := EL_D - EL_J = 1500 \cdot mm$

5.0 UPLIFT & HYDROSTATIC LOADS

5.1 Uplift Pressures for Stability Analyses

Determine water pressures for designated coordinates using full headwater uplift pressure at the heel and full tailwater uplift pressure at the toe. Uplift distribution is assumed linear from heel to toe.

Hydrostatic pressure at Heel $\quad u_h := \gamma_w \cdot \left(EL_{hw} - EL_J\right) = 20 \cdot kPa$

Hydrostatic pressure at Toe $\quad u_t := \gamma_w \cdot \left(EL_{tw} - EL_E\right) = 5 \cdot kPa$

Total uplift loads on base $\quad P_u := \frac{\left(u_h + u_t\right)}{2} \cdot L_{base} \cdot b = 39.85 \cdot kN$

Uplift resultant location $\quad x_u := \frac{L_{base}}{2} + \frac{L_{base}}{6} \cdot \frac{\left(u_h - u_t\right)}{u_t + u_h} = 1.95 \cdot m$

Uplift Moment about Toe $\quad M_u := P_u \cdot x_u = 77.7 \cdot kN \cdot m$

5.2 Headwater Hydrostatic Load - Heel Side

Headwater hydrostatic load $P_{hw} := \frac{1}{2} u_h \cdot (EL_{hw} - EL_J) \cdot b = 19.6 \cdot kN$

Headwater moment arm $y_{hw} := \frac{1}{3}(EL_{hw} - EL_J) - h_{key} = -0.83 \cdot m$

Headwater Moment about Toe $M_{hw} := P_{hw} \cdot y_{hw} = -16.4 \cdot kN \cdot m$

5.3 Tailwater Hydrostatic Load - Toe Side

Tailwater hydrostatic load $P_{tw} := \frac{1}{2} \gamma_w \cdot (EL_{tw} - EL_K)^2 \cdot b = 19.62 \cdot kN$

Tailwater moment arm $y_{tw} := h_{key} - \frac{1}{3}(EL_{tw} - EL_K) = 0.83 \cdot m$

Tailwater Moment about Toe $M_{tw} := P_{tw} \cdot y_{tw} = 16.35 \cdot kN \cdot m$

<u>6.0 LATERAL EARTH PRESSURE</u>

6.1 Lateral Soil Load on Toe Side

Soil pressure at Saturation Level

$$p_{tw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 4.0 \cdot kPa$$

Soil pressure at Toe - base elevation

$$p_E := \begin{cases} p_{tw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_J) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_J) & \text{otherwise} \end{cases}$$

$p_E = 16.04 \cdot kPa$

Total soil loads on Wall

$$P_{soil\_t} := \left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} + p_{tw} \cdot (EL_{tw} - EL_J) \ldots + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)\right] \cdot b = 20.65 \cdot kN$$

Resultant location

$$y_{soil\_t} := \begin{cases} 0 & \text{if } P_{soil\_t} = 0 \\ h_{key} - \dfrac{\left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} \cdot \left[(EL_{tw} - EL_J) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_{tw} \cdot \frac{1}{2}(EL_{tw} - EL_J)^2 \ldots + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{soil\_t}} & \text{otherwise} \end{cases}$$

$y_{soil\_t} = 0.66 \cdot m$

Moment about Toe $M_{soil\_t} := P_{soil\_t} \cdot y_{soil\_t} = 13.62 \cdot kN \cdot m$

6.2 Lateral Soil Load on Heel Side

Soil pressure at Saturation Level

$$p_{hw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0psf & \text{otherwise} \end{cases} = 32.6 \cdot kPa$$

Soil pressure at Heel - base elevation

$$p_D := \begin{cases} p_{hw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_J) & \text{if } EL_B > EL_{hw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_J) & \text{otherwise} \end{cases}$$

$$p_D = 44.72 \cdot kPa$$

Total soil loads on Base

$$P_{soil\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} + p_{hw} \cdot (EL_{hw} - EL_J) \ldots \atop + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)\right] \cdot b$$

$$P_{soil\_h} = 122.22 \cdot kN$$

Resultant location

$$y_{soil\_h} := \frac{\left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} \cdot \left[EL_{hw} - EL_J + \frac{1}{3}(EL_B - EL_{hw})\right] + p_{hw} \cdot \frac{1}{2}(EL_{hw} - EL_J)^2 \ldots \atop + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{soil\_h}} - h_{key}$$

$$y_{soil\_h} = 0.17 \cdot m$$

Moment about Toe

$$M_{soil\_h} := P_{soil\_h} \cdot y_{soil\_h} = 20.9 \cdot kN \cdot m$$

6.3 Surcharge Soil Load - Heel Side

Surcharge soil pressure

$$p_{sur} := k_o \cdot \gamma_{soilm} \cdot h_{sur} = 0 \cdot kPa$$

Soil load on wall

$$P_{sur} := p_{sur} \cdot (EL_B - EL_J) \cdot b = 0 \cdot kN$$

Resultant location

$$y_{sur} := \frac{1}{2} \cdot (EL_B - EL_J) - h_{key} = 0.88\, m$$

Moment about Toe

$$M_{sur} := P_{sur} \cdot y_{sur} = 0 \cdot kN \cdot m$$

6.4 Seismic Lateral Soil Load on Toe Side - Woods Method (Data Source 3)

Weighted Average of unit weights

$$\gamma_{EQ\_t} := \frac{\left[\gamma_{soilsat}\cdot\left(EL_F - EL_{tw}\right) + \left(\gamma_{soilsat} - \gamma_w\right)\cdot\left(EL_{tw} - EL_J\right)\right]}{\left(EL_F - EL_J\right)}$$

$$\gamma_{EQ\_t} = 11.59\cdot\frac{kN}{m^3}$$

Seismic Lat. soil load on Wall

$$P_{E\_soil\_t} := \gamma_{EQ\_t}\cdot\left(EL_F - EL_J\right)^2\cdot b\cdot k_h = 11.99\cdot kN$$

Resultant location

$$y_{E\_soil\_t} := h_{key} - 0.63\left(EL_F - EL_J\right) = 0.03\ m$$

Moment about Toe

$$M_{E\_soil\_t} := P_{E\_soil\_t}\cdot y_{E\_soil\_t} = 0.36\cdot kN\cdot m$$

6.5 Seismic Lateral Soil Load on Heel Side - Woods Method (Data Source 3)

Weighted Average of unit weights

$$\gamma_{EQ\_h} := \frac{\left[\gamma_{soilsat}\cdot\left(EL_B - EL_{hw}\right) + \left(\gamma_{soilsat} - \gamma_w\right)\cdot\left(EL_{hw} - EL_J\right)\right]}{\left(EL_B - EL_J\right)}$$

$$\gamma_{EQ\_h} = 15.87\cdot\frac{kN}{m^3}$$

Seismic Lat. soil loads on Wal

$$P_{E\_soil\_h} := \gamma_{EQ\_h}\cdot\left(EL_B - EL_J\right)^2\cdot b\cdot k_h = 68.03\cdot kN$$

Resultant location

$$y_{E\_soil\_h} := 0.63\left(EL_B - EL_J\right) - h_{key} = 1.49\ m$$

Moment about Toe

$$M_{E\_soil\_h} := P_{E\_soil\_h}\cdot y_{E\_soil\_h} = 101.54\cdot kN\cdot m$$

7.0 GRAVITY LOADS

7.1 Weight of Concrete

Weight of Wall footing/base

$$W_{conc} := \gamma_c\cdot\left(t_{base}\cdot L_{base} + L_{stem}\cdot t_{stem} + t_{key}\cdot h_{key}\right)\cdot b = 88.13\cdot kN$$

Resultant location

$$x_{conc} := \frac{\left[\frac{1}{2}t_{base}\cdot L_{base}{}^2 + L_{stem}\cdot t_{stem}\cdot\left(L_{toe} + 0.5t_{stem}\right) \ldots \atop + t_{key}\cdot h_{key}\cdot\left(L_{base} - 0.5t_{key}\right)\right]}{t_{base}\cdot L_{base} + L_{stem}\cdot t_{stem} + t_{key}\cdot h_{key}} = 1.64\ m$$

$$y_{conc} := \frac{\left[\frac{1}{2} t_{base}{}^{2} \cdot L_{base} + L_{stem} \cdot t_{stem} \cdot \left(\frac{1}{2} L_{stem} + t_{base}\right) \cdots \\ + t_{key} \cdot h_{key} \cdot \left(-0.5 t_{key}\right)\right]}{t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}} = 0.82\,\mathrm{m}$$

Moment about Toe $M_{conc} := W_{conc} \cdot x_{conc} = 144.11 \cdot kN \cdot m$

7.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{soil\_h} := b \cdot L_{heel} \cdot \begin{cases} (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{if } EL_B < EL_{hw} \\ \gamma_{soilm} \cdot (EL_B - EL_{hw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max[0, (EL_{hw} - EL_C)] & \text{otherwise} \end{cases}$$

$$W_{soil\_h} = 110 \cdot kN$$

Resultant location $x_{s\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

$y_{s\_h} := 0.5(EL_B - EL_C) + t_{base} = 1.88 \cdot m$

Moment about Toe $M_{soilw\_h} := W_{soil\_h} \cdot x_{s\_h} = 247.5 \cdot kN \cdot m$

7.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_h} := \gamma_w \cdot \max[0kip, (EL_{hw} - EL_C)] \cdot L_{heel} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

$y_{w\_h} := 0.5(EL_{hw} - EL_C) + t_{base} = 0.5 \cdot m$

Moment about Toe $M_{w\_h} := W_{w\_h} \cdot x_{w\_h} = 0 \cdot kN \cdot m$

7.4 Weight of Soil on Toe

Weight of Soil on toe Note: Water and soil elevations MUST NOT be below footing elevation

$$W_{soil\_t} := b \cdot L_{toe} \cdot \begin{cases} (\gamma_{soilsat} - \gamma_w) \cdot (\max(0, EL_F - EL_C)) & \text{if } EL_F < EL_{tw} \\ \gamma_{soilm} \cdot \max(0, EL_F - EL_{tw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max(EL_{tw} - EL_C, 0) & \text{otherwise} \end{cases}$$

$$W_{soil\_t} = 5 \cdot kN$$

Resultant location $x_{s\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

$y_{s\_t} := 0.5(EL_F - EL_C) + t_{base} = 0.67 \cdot m$

Moment about Toe $M_{soilw\_t} := W_{soil\_t} \cdot x_{s\_t} = 1.9 \cdot kN \cdot m$

7.5 Weight of Water on Toe

Weight of Water on toe $W_{w\_t} := \gamma_w \cdot \max[0kip, (EL_{tw} - EL_C)] \cdot L_{toe} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

$y_{w\_t} := 0.5(EL_{tw} - EL_C) + t_{base} = 0.5 \cdot m$

Moment about Toe $M_{w\_t} := W_{w\_t} \cdot x_{w\_t} = 0 \cdot kN \cdot m$

7.6 Weight of Soil under Footing and Above Failure Plane EJ

Depth of Soil Wedge Near Key $h_{s\_under} := (x_L - x_E)\cdot\frac{h_{key}}{L_{base}} = 1.29\,m$

Length of Soil Wedge $L_{s\_under} := x_L - x_E = 2.8\,m$

Weight of Soil Wedge Under Footing $W_{s\_under} := \gamma_{soilsat}\cdot(0.5\cdot h_{s\_under}\cdot L_{s\_under})\cdot b = 36.18\cdot kN$

Resultant location $x_{s\_under} := \frac{2}{3}(x_L - x_E) = 1.87\cdot m$

$y_{s\_under} := \frac{1}{3}h_{key} = 0.5\cdot m$

Moment about Toe $M_{s\_under} := W_{s\_under}\cdot x_{s\_under} = 67.5\cdot kN\cdot m$

7.7 Seismic Inertial Moments from Gravity Loads

Concrete

Due to vertical component $M_{Ev\_conc} := k_v\cdot W_{conc}\cdot x_{conc} = -4.32\cdot kN\cdot m$

Due to horizontal component $M_{Eh\_conc} := k_h\cdot W_{conc}\cdot y_{conc} = 13.76\cdot kN\cdot m$

Soils on Heel

Due to vertical component $M_{Ev\_soilw\_h} := k_v\cdot W_{soil\_h}\cdot x_{s\_h} = -7.42\cdot kN\cdot m$

Due to horizontal component $M_{Eh\_soilw\_h} := k_h\cdot W_{soil\_h}\cdot y_{s\_h} = 39.19\cdot kN\cdot m$

Soils on Toe

Due to vertical component $M_{Ev\_soilw\_t} := k_v\cdot W_{soil\_t}\cdot x_{s\_t} = -0.06\cdot kN\cdot m$

Due to horizontal component $M_{Eh\_soilw\_t} := k_h\cdot W_{soil\_t}\cdot y_{s\_t} = 0.63\cdot kN\cdot m$

Soil Under Base

Due to vertical component $M_{Ev\_s\_under} := k_v\cdot W_{s\_under}\cdot x_{s\_under} = -2.03\cdot kN\cdot m$

Due to horizontal component $M_{Eh\_s\_under} := k_h\cdot W_{s\_under}\cdot(-y_{s\_under}) = -3.44\cdot kN\cdot m$

Water on Heel

Due to vertical component $M_{Ev\_w\_h} := k_v\cdot W_{w\_h}\cdot x_{w\_h} = 0\cdot kN\cdot m$

Due to horizontal component $M_{Eh\_w\_h} := k_h\cdot W_{w\_h}\cdot y_{w\_h} = 0\cdot kN\cdot m$

Water on Toe

Due to vertical component $M_{Ev\_w\_t} := k_v \cdot W_{w\_t} \cdot x_{w\_t} = 0 \cdot kN \cdot m$

Due to horizontal component $M_{Eh\_w\_t} := k_h \cdot W_{w\_t} \cdot y_{w\_t} = 0 \cdot kN \cdot m$

Total Moment due to Horizontal Seismic Coefficient:

$$M_{EQ\_h} := M_{Eh\_conc} + M_{Eh\_soilw\_h} + M_{Eh\_soilw\_t} + M_{Eh\_s\_under} + M_{Eh\_w\_h} + M_{Eh\_w\_t} = 50.14 \cdot kN \cdot m$$

Total Moment due to Vertical Seismic Coefficient:

$$M_{EQ\_v} := M_{Ev\_conc} + M_{Ev\_soilw\_h} + M_{Ev\_soilw\_t} + M_{Ev\_s\_under} + M_{Ev\_w\_h} + M_{Ev\_w\_t} = -13.83 \cdot kN \cdot m$$

Net Seismic Moment $M_{EQ} := M_{EQ\_v} - M_{EQ\_h} - M_{E\_soil\_h} + M_{E\_soil\_t} = -165.15 \cdot kN \cdot m$

8.0 Overturning Stability Assessment - See Figure 2

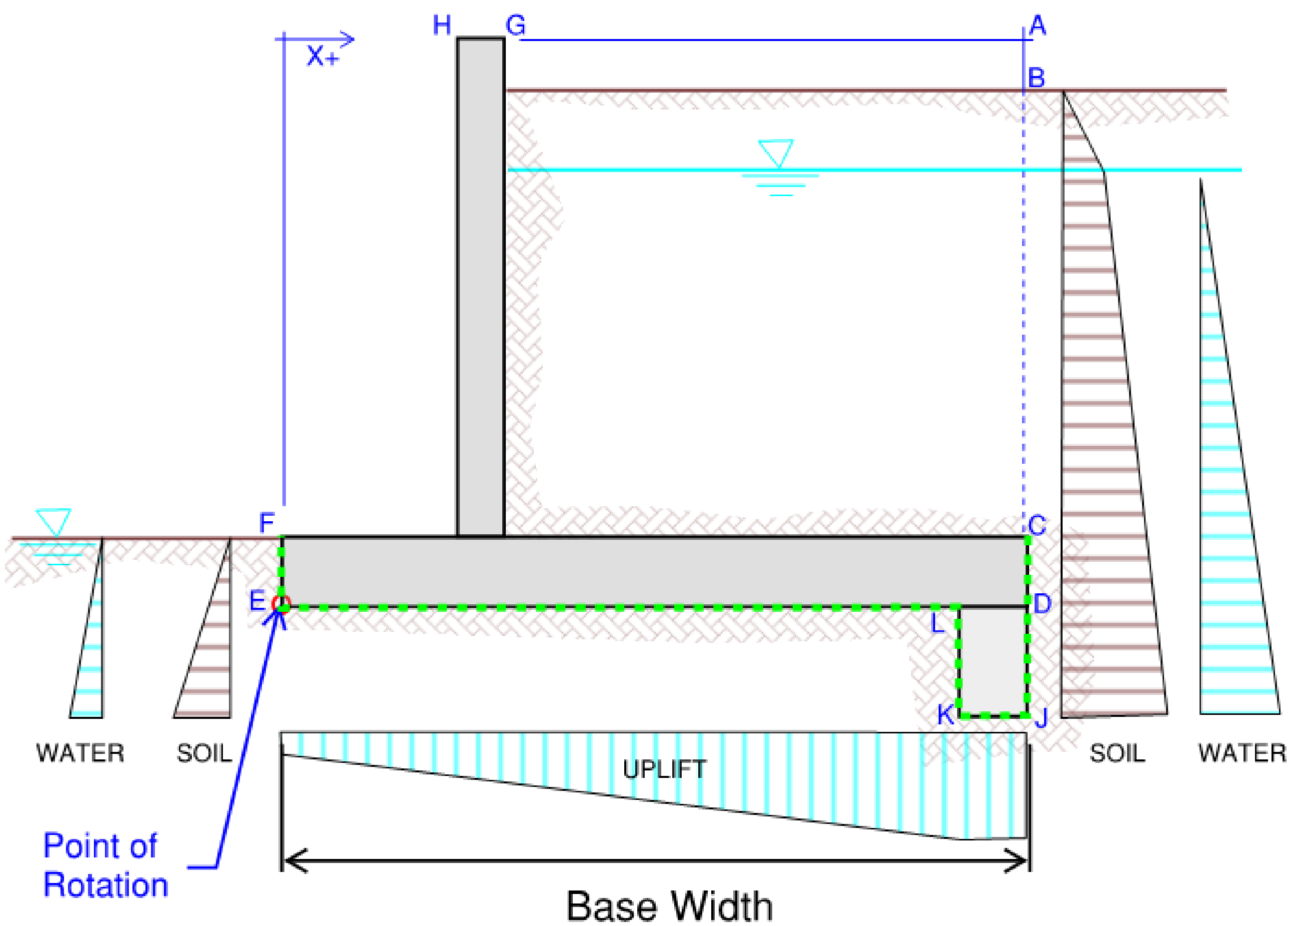

Figure 2. Free Body Diagram for Overturning Analysis

Uplift loads for Overturning

$$P_{u\_ot} := \left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]\cdot b = 43.16\cdot kN$$

Uplift resultant location

$$x_{u\_ot} := \frac{\left[\left[\frac{x_L - x_E}{2} + \frac{x_L - x_E}{6}\cdot\frac{\left(u_h - u_t\right)}{u_t + u_h}\right]\cdot\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right)\right] \cdots + \left(L_{base} - 0.5t_{key}\right)\cdot\left(u_h\cdot t_{key}\right)\right]}{\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]}$$

$$x_{u\_ot} = 1.96\,m$$

Uplift Moment about Toe

$$M_{u\_ot} := P_{u\_ot}\cdot x_{u\_ot} = 84.4\cdot kN\cdot m$$

Vertical Seismic Loads

$$EQ_v := k_v\cdot\left(W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}\right) = -6.09\cdot kN$$

Horizontal Seismic Loads

$$EQ_h := k_h\cdot\left(W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}\right) = 38.59\cdot kN$$

Total Vertical Forces

$$\Sigma V_{ot} := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t} - P_{u\_ot} + EQ_v = 153.9\cdot kN$$

Total Horizontal Forces

$$\Sigma H_{ot} := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} \cdots + P_{E\_soil\_t} + P_{E\_soil\_h} + EQ_h = 220.17\cdot kN$$

Total Resisting Moments - Static

$$\Sigma M_{r\_ot} := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} = 393.5\cdot kN\cdot m$$

Total Driving Moments - Static

$$\Sigma M_{d\_ot} := M_{hw} + M_{soil\_h} + M_{sur} + M_{u\_ot} \cdots + M_{tw} + M_{soil\_t} = 118.9\cdot kN\cdot m$$

Resultant Location from Toe

$$x_{r\_ot} := \frac{\Sigma M_{r\_ot} - \Sigma M_{d\_ot} + M_{EQ}}{\Sigma V_{ot}} = 0.71\cdot m$$

Normalized Resultant Location

$$\frac{x_{r\_ot}}{L_{base}} = 0.219$$

Eccentricity

$$e_{x\_ot} := \frac{L_{base}}{2} - x_{r\_ot} = 0.91\cdot m$$

Approx. Base in Compression $l_{comp\_ot} := \min\left[L_{base}, \frac{3}{2}\cdot\left(L_{base} - 2\cdot e_{x\_ot}\right)\right] = 2.13\cdot m$

Percent Base in Compression $Base\_Comp := \left(\frac{l_{comp\_ot}}{L_{base}}\right) = 65.7\cdot\%$

Resultant Location Check $check_{res} := if\left(Base\_Comp \geq Base\_Comp_{Req}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

9.0 Flotation Stability Assessment - See Figure 2

Calculated Flotation Safety Factor $FS_f := \frac{W_{conc} + W_{soil\_h} + W_{soil\_t} + W_{w\_h} + W_{w\_t} + EQ_v}{P_{u\_ot}} = 4.6$

Flotation Stability Check $check_{floatation} := if\left(FS_f \geq FS_{float}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

10.0 Sliding Stability Assessment - See Figure 3

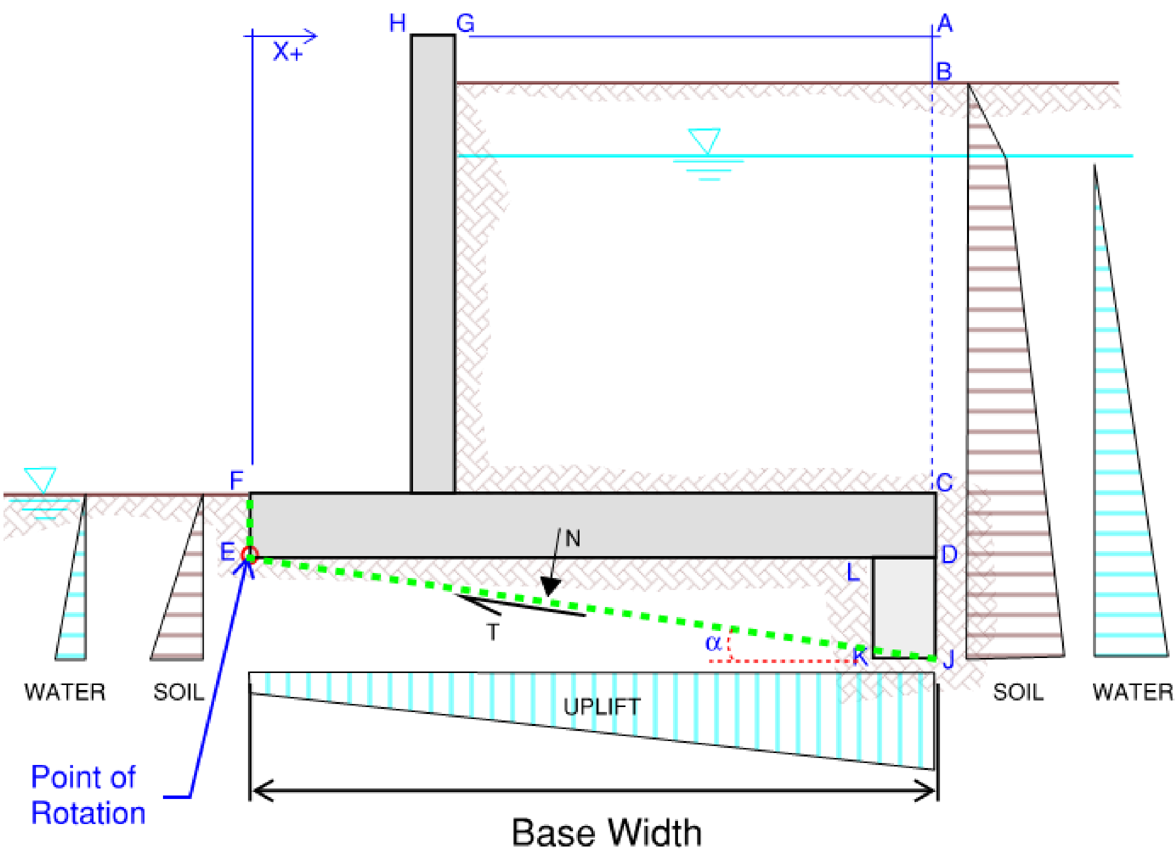

Figure 3. Free Body Diagram for Sliding Analysis

Length of Sliding Failure Plane, EJ $L_{fp} := \sqrt{{L_{base}}^2 + {h_{key}}^2} = 3.58\,m$

Angle of Sliding Failure Plane From Horizontal $\alpha := \operatorname{atan}\left(\frac{h_{key}}{L_{base}}\right) = 24.8 \cdot deg$

Total Vertical Forces $\Sigma V := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{s\_under} + W_{w\_t} - P_u + EQ_v = 193.4 \cdot kN$

Total Horizontal Forces $\Sigma H := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} + EQ_h = 140.16 \cdot kN$

Total Resisting Moments - Static $\Sigma M_r := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} + M_{s\_under} = 461\ m \cdot kN$

Total Driving Moments - Static $\Sigma M_d := M_{hw} + M_{soil\_h} + M_{sur} + M_u \cdots + M_{tw} + M_{soil\_t} = 112.2 \cdot kN \cdot m$

Normal Force on Sliding Failure Plane: $N_s := \Sigma H \cdot \sin(\alpha) + \Sigma V \cdot \cos(\alpha) = 234.3 \cdot kN$

Tangential Force on Sliding Failure Plane: $T_s := \Sigma H \cdot \cos(\alpha) - \Sigma V \cdot \sin(\alpha) = 46.23 \cdot kN$

Calculated Sliding Safety Factor $\boxed{FS_s := \frac{N_s \cdot \tan(0.95\phi_{soil})}{T_s} = 2.13}$

Sliding Stability Check $check_{sliding} := \text{if}\left(FS_s \geq FS_{Sliding}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

11.0 Bearing Capacity Assessment

Resultant Location from Toe $x_r := \frac{\Sigma M_r - \Sigma M_d + M_{EQ}}{N_s} = 0.78 \cdot m$

Eccentricity of N_s from center of base $e_s := \frac{L_{fp}}{2} - x_r = 1.01 \cdot m$

Approx. Base in Compression $l_{comp.s} := \min\left[L_{fp}, \frac{3}{2} \cdot \left(L_{fp} - 2 \cdot e_s\right)\right] = 2.35 \cdot m$

Updated Eccentricity $e_x := \frac{l_{comp.s} - L_{fp}}{2} + e_s = 0.39 \cdot m$

Effective base pressure at Toe $q_t := \left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 + \frac{6 \cdot e_x}{l_{comp.s}}\right) = 199.23 \cdot kPa$

Effective base pressure at Heel $q_h := \max\left[\left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 - \frac{6 \cdot e_x}{l_{comp.s}}\right), 0\right] = 0.00 \cdot kPa$

Calculated Bearing Safety Factor $FS_b := \frac{Q_b}{\max(q_t, q_h)} = 2.26$

Bearing Pressure Check $check_{bearing} := if(FS_b \geq FS_{Bearing}, "OK", "NG") = "OK"$

12.0 Summary of Stability Assessments

Base Compression / Resultant Location $Base\_Comp = 65.7 \cdot \%$

Flotation Stability $FS_f = 4.6$

Sliding Stability $FS_s = 2.1$

Bearing Pressure $FS_b = 2.3$

STABILITY ANALYSIS FOR CANTILEVER WALL WITH KEY

Project / Client: Springbank Off-Stream Storage (SR1) / Alberta Transportation

Section Location: Intake Structure Wing Wall - Closest to Intake Structure

1.0 OBJECTIVE

For a particular load condition, analyze a reinforced concrete cantilever wall with shear key for overturning, sliding, flotation, and bearing capacity in accordance with criteria described in the listed references.

2.0 BACKGROUND INFORMATION

2.1 DATA SOURCES

1- Soils Report - Recommended Geotechnical Soil Parameters, SR-1 Low Level Outlet (LLO) Structures. July 19, 2019

2- Drawings - Design Drawings

3- Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM) , 2019

2.2 REFERENCES

1. (CDA) Dam Safety Guidelines, 2007 (revised 2013).

2. "Water Control Structures Selected Design Guidelines," Alberta Transportation & Alberta Environment, Calgary Alberta, November 2004.

3.0 DESIGN PARAMETERS AND CRITERIA

3.1 Stability Analysis Criteria (Data source 2)

Load Case	$LC := 4$ $EQ := 3$
Load Case Description	$vlookup(LC, CASES, 1)_0 = $ "Earthquake"
Sliding Minimum Factor of Safety	$FS_{Sliding} := vlookup(LC, CASES, 2)_0 = 1$
Overturning Criteria	$Base\_Comp_{Req} := vlookup(LC, CASES, 3)_0 = 0.1 \cdot \%$
Bearing Capacity Minimum Factor of Safety	$FS_{Bearing} := vlookup(LC, CASES, 4)_0 = 1$
Flotation Minimum Factor of Safety	$FS_{float} := vlookup(LC, CASES, 5)_0 = 1$

3.2 Applied Loads

Heel side water elevation $EL_{hw} := \text{vlookup}(LC, WaterEL, 1)_0 \cdot 1m = 1187\,m$ Data Source 2

Toe side water elevation $EL_{tw} := \text{vlookup}(LC, WaterEL, 2)_0 \cdot 1m = 1187\,m$

Equivalent soil surcharge $h_{sur} := \begin{cases} 1.0m & \text{if } LC = 2 \\ 0 & \text{otherwise} \end{cases} = 0 \cdot m$

Horizontal Seismic Coefficient $k_h := \begin{cases} \text{vlookup}(EQ, CASES_{eq}, 1)_0 & \text{if } LC = 4 \\ 0 & \text{otherwise} \end{cases} = 0.19$

Vertical Seismic Coefficient $k_v := \begin{cases} \text{vlookup}(EQ, CASES_{eq}, 2)_0 & \text{if } LC = 4 \\ 0 & \text{otherwise} \end{cases} = -0.03$

3.3 Material Properties - Data Source 1 Unless Otherwise Noted

Unit Weight of Water $\gamma_w := 9.81 \frac{kN}{m^3}$

Unit Weight of Concrete $\gamma_c := 23.5 \cdot \frac{kN}{m^3}$ Data Source 3

Unit Weight of Soil (Moist) $\gamma_{soilm} := 20 \frac{kN}{m^3}$

Soil Unit Weight Beneath Base (Saturated) $\gamma_{soilsat} := 20 \frac{kN}{m^3}$

Soil Cohesion - Drained $c_{soil} := 0kPa$

Soil Angle of Internal Friction - Drained $\phi_{soil} := 24deg$

Soil Ultimate Bearing Pressure $Q_b := 450kPa$

Slope of backfill (Conservative) $\beta := 0$

At-rest lateral earth pressure coefficient $k_o := 1 - \sin(\phi_{soil}) = 0.59$

4.0 WALL SECTION DESCRIPTION

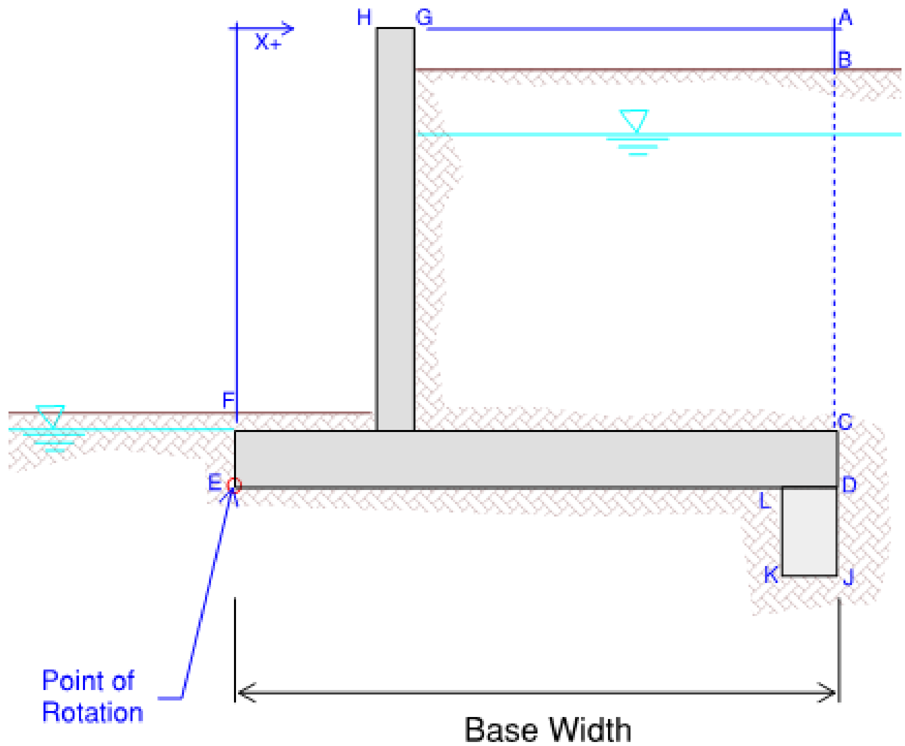

Figure 1. Cantilever Wall Section

4.1 Point Locations (Refer to Figure 1 and Drawings)

A - Top of wall	$EL_A := 1189.9m$	$x_A := 3.25m$
B - Top of fill - reservoir side	$EL_B := 1189.75m$	$x_B := x_A = 3.25 \cdot m$
C - Top of Heel	$EL_C := 1187m$	$x_C := x_A = 3.25 \cdot m$
D - Heel side end of footing	$EL_D := EL_C - 500mm = 1186.50\ m$	$x_D := x_A = 3.25 \cdot m$
E - Toe side end of footing	$EL_E := EL_D = 1186.50 \cdot m$	$x_E := 0m$
F - Top of Fill - land side	$EL_F := EL_C + 333mm = 1187.33 \cdot m$	$x_F := x_E = 0$
G - Heel side face of wall stem	$EL_G := EL_A = 1189.90 \cdot m$	$x_G := 1.25m$
H - Toe side face of wall stem	$EL_H := EL_A = 1189.90 \cdot m$	$x_H := x_G - 0.500m = 0.75 \cdot m$

J - Bottom of key - heel side	$EL_J := EL_C - 2m = 1185.00 \cdot m$	$x_J := x_D = 3.25\,m$
K - Bottom of key - toe side	$EL_K := EL_J = 1185.00 \cdot m$	$x_K := x_J - 450mm = 2.8 \cdot m$
L - Top of key	$EL_L := EL_D = 1186.50 \cdot m$	$x_L := x_K = 2.8\,m$

4.2 Additional Analysis Dimensions

Analysis Width	$b := 1m$
Length of base	$L_{base} := x_D - x_E = 3.25 \cdot m$
Thickness of base	$t_{base} := EL_C - EL_D = 500 \cdot mm$
Length of stem	$L_{stem} := EL_A - EL_C = 2900 \cdot mm$
Thickness of stem	$t_{stem} := x_G - x_H = 500 \cdot mm$
Length of Heel	$L_{heel} := x_A - x_G = 2000 \cdot mm$
Length of Toe	$L_{toe} := x_H - x_F = 750 \cdot mm$
Thickness of Key	$t_{key} := x_J - x_K = 450 \cdot mm$
Height of Key	$h_{key} := EL_D - EL_J = 1500 \cdot mm$

5.0 UPLIFT & HYDROSTATIC LOADS

5.1 Uplift Pressures for Stability Analyses

Determine water pressures for designated coordinates using full headwater uplift pressure at the heel and full tailwater uplift pressure at the toe. Uplift distribution is assumed linear from heel to toe.

Hydrostatic pressure at Heel $\quad u_h := \gamma_w \cdot (EL_{hw} - EL_J) = 20 \cdot kPa$

Hydrostatic pressure at Toe $\quad u_t := \gamma_w \cdot (EL_{tw} - EL_E) = 5 \cdot kPa$

Total uplift loads on base $\quad P_u := \frac{(u_h + u_t)}{2} \cdot L_{base} \cdot b = 39.85 \cdot kN$

Uplift resultant location $\quad x_u := \frac{L_{base}}{2} + \frac{L_{base}}{6} \cdot \frac{(u_h - u_t)}{u_t + u_h} = 1.95 \cdot m$

Uplift Moment about Toe $\quad M_u := P_u \cdot x_u = 77.7 \cdot kN \cdot m$

5.2 Headwater Hydrostatic Load - Heel Side

Headwater hydrostatic load $P_{hw} := \frac{1}{2} u_h \cdot (EL_{hw} - EL_J) \cdot b = 19.6 \cdot kN$

Headwater moment arm $y_{hw} := \frac{1}{3}(EL_{hw} - EL_J) - h_{key} = -0.83 \cdot m$

Headwater Moment about Toe $M_{hw} := P_{hw} \cdot y_{hw} = -16.4 \cdot kN \cdot m$

5.3 Tailwater Hydrostatic Load - Toe Side

Tailwater hydrostatic load $P_{tw} := \frac{1}{2} \gamma_w \cdot (EL_{tw} - EL_K)^2 \cdot b = 19.62 \cdot kN$

Tailwater moment arm $y_{tw} := h_{key} - \frac{1}{3}(EL_{tw} - EL_K) = 0.83 \cdot m$

Tailwater Moment about Toe $M_{tw} := P_{tw} \cdot y_{tw} = 16.35 \cdot kN \cdot m$

6.0 LATERAL EARTH PRESSURE

6.1 Lateral Soil Load on Toe Side

Soil pressure at Saturation Level

$$p_{tw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 4.0 \cdot kPa$$

Soil pressure at Toe - base elevation

$$p_E := \begin{cases} p_{tw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_J) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_J) & \text{otherwise} \end{cases}$$

$$p_E = 16.04 \cdot kPa$$

Total soil loads on Wall

$$P_{soil\_t} := \left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} + p_{tw} \cdot (EL_{tw} - EL_J) \ldots + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J) \right] \cdot b = 20.65 \cdot kN$$

Resultant location

$$y_{soil\_t} := \begin{cases} 0 & \text{if } P_{soil\_t} = 0 \\ h_{key} - \dfrac{\left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} \cdot \left[(EL_{tw} - EL_J) + \frac{1}{3}(EL_F - EL_{tw}) \right] + p_{tw} \cdot \frac{1}{2} (EL_{tw} - EL_J)^2 \ldots + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)^2 \cdot \frac{1}{3} \right] \cdot b}{P_{soil\_t}} & \text{otherwise} \end{cases}$$

$$y_{soil\_t} = 0.66 \cdot m$$

Moment about Toe $M_{soil\_t} := P_{soil\_t} \cdot y_{soil\_t} = 13.62 \cdot kN \cdot m$

6.2 Lateral Soil Load on Heel Side

Soil pressure at Saturation Level

$$p_{hw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0psf & \text{otherwise} \end{cases} = 32.6 \cdot kPa$$

Soil pressure at Heel - base elevation

$$p_D := \begin{cases} p_{hw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_J) & \text{if } EL_B > EL_{hw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_J) & \text{otherwise} \end{cases}$$

$$p_D = 44.72 \cdot kPa$$

Total soil loads on Base

$$P_{soil\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} + p_{hw} \cdot (EL_{hw} - EL_J) \dots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J) \right] \cdot b$$

$$P_{soil\_h} = 122.22 \cdot kN$$

Resultant location

$$y_{soil\_h} := \frac{\left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} \cdot \left[EL_{hw} - EL_J + \frac{1}{3}(EL_B - EL_{hw}) \right] + p_{hw} \cdot \frac{1}{2} (EL_{hw} - EL_J)^2 \dots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)^2 \cdot \frac{1}{3} \right] \cdot b}{P_{soil\_h}} - h_{key}$$

$$y_{soil\_h} = 0.17 \cdot m$$

Moment about Toe

$$M_{soil\_h} := P_{soil\_h} \cdot y_{soil\_h} = 20.9 \cdot kN \cdot m$$

6.3 Surcharge Soil Load - Heel Side

Surcharge soil pressure

$$p_{sur} := k_o \cdot \gamma_{soilm} \cdot h_{sur} = 0 \cdot kPa$$

Soil load on wall

$$P_{sur} := p_{sur} \cdot (EL_B - EL_J) \cdot b = 0 \cdot kN$$

Resultant location

$$y_{sur} := \frac{1}{2} \cdot (EL_B - EL_J) - h_{key} = 0.88\, m$$

Moment about Toe

$$M_{sur} := P_{sur} \cdot y_{sur} = 0 \cdot kN \cdot m$$

6.4 Seismic Lateral Soil Load on Toe Side - Woods Method (Data Source 3)

Weighted Average of unit weights

$$\gamma_{EQ\_t} := \frac{\left[\gamma_{soilsat}\cdot\left(EL_F - EL_{tw}\right) + \left(\gamma_{soilsat} - \gamma_w\right)\cdot\left(EL_{tw} - EL_J\right)\right]}{\left(EL_F - EL_J\right)}$$

$$\gamma_{EQ\_t} = 11.59\cdot\frac{kN}{m^3}$$

Seismic Lat. soil load on Wall

$$P_{E\_soil\_t} := \gamma_{EQ\_t}\cdot\left(EL_F - EL_J\right)^2\cdot b\cdot k_h = 11.99\cdot kN$$

Resultant location

$$y_{E\_soil\_t} := h_{key} - 0.63\left(EL_F - EL_J\right) = 0.03\ m$$

Moment about Toe

$$M_{E\_soil\_t} := P_{E\_soil\_t}\cdot y_{E\_soil\_t} = 0.36\cdot kN\cdot m$$

6.5 Seismic Lateral Soil Load on Heel Side - Woods Method (Data Source 3)

Weighted Average of unit weights

$$\gamma_{EQ\_h} := \frac{\left[\gamma_{soilsat}\cdot\left(EL_B - EL_{hw}\right) + \left(\gamma_{soilsat} - \gamma_w\right)\cdot\left(EL_{hw} - EL_J\right)\right]}{\left(EL_B - EL_J\right)}$$

$$\gamma_{EQ\_h} = 15.87\cdot\frac{kN}{m^3}$$

Seismic Lat. soil loads on Wal

$$P_{E\_soil\_h} := \gamma_{EQ\_h}\cdot\left(EL_B - EL_J\right)^2\cdot b\cdot k_h = 68.03\cdot kN$$

Resultant location

$$y_{E\_soil\_h} := 0.63\left(EL_B - EL_J\right) - h_{key} = 1.49\ m$$

Moment about Toe

$$M_{E\_soil\_h} := P_{E\_soil\_h}\cdot y_{E\_soil\_h} = 101.54\cdot kN\cdot m$$

7.0 GRAVITY LOADS

7.1 Weight of Concrete

Weight of Wall footing/base

$$W_{conc} := \gamma_c\cdot\left(t_{base}\cdot L_{base} + L_{stem}\cdot t_{stem} + t_{key}\cdot h_{key}\right)\cdot b = 88.13\cdot kN$$

Resultant location

$$x_{conc} := \frac{\left[\begin{array}{l}\frac{1}{2}t_{base}\cdot L_{base}{}^2 + L_{stem}\cdot t_{stem}\cdot\left(L_{toe} + 0.5t_{stem}\right)\ \ldots \\ + t_{key}\cdot h_{key}\cdot\left(L_{base} - 0.5t_{key}\right)\end{array}\right]}{t_{base}\cdot L_{base} + L_{stem}\cdot t_{stem} + t_{key}\cdot h_{key}} = 1.64\ m$$

$$y_{conc} := \frac{\left[\frac{1}{2}t_{base}^{2}\cdot L_{base} + L_{stem}\cdot t_{stem}\cdot\left(\frac{1}{2}L_{stem} + t_{base}\right) \cdots \atop + t_{key}\cdot h_{key}\cdot(-0.5t_{key})\right]}{t_{base}\cdot L_{base} + L_{stem}\cdot t_{stem} + t_{key}\cdot h_{key}} = 0.82\,m$$

Moment about Toe $M_{conc} := W_{conc}\cdot x_{conc} = 144.11\cdot kN\cdot m$

7.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{soil\_h} := b \cdot L_{heel} \cdot \begin{cases} (\gamma_{soilsat} - \gamma_w)\cdot(EL_B - EL_C) & \text{if } EL_B < EL_{hw} \\ \gamma_{soilm}\cdot(EL_B - EL_{hw}) + (\gamma_{soilsat} - \gamma_w)\cdot \max[0, (EL_{hw} - EL_C)] & \text{otherwise} \end{cases}$$

$$W_{soil\_h} = 110 \cdot kN$$

Resultant location $x_{s\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

$y_{s\_h} := 0.5(EL_B - EL_C) + t_{base} = 1.88 \cdot m$

Moment about Toe $M_{soilw\_h} := W_{soil\_h} \cdot x_{s\_h} = 247.5 \cdot kN \cdot m$

7.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_h} := \gamma_w \cdot \max[0kip, (EL_{hw} - EL_C)] \cdot L_{heel} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

$y_{w\_h} := 0.5(EL_{hw} - EL_C) + t_{base} = 0.5 \cdot m$

Moment about Toe $M_{w\_h} := W_{w\_h} \cdot x_{w\_h} = 0 \cdot kN \cdot m$

7.4 Weight of Soil on Toe

Weight of Soil on toe Note: Water and soil elevations MUST NOT be below footing elevation

$$W_{soil\_t} := b \cdot L_{toe} \cdot \begin{cases} (\gamma_{soilsat} - \gamma_w)\cdot(\max(0, EL_F - EL_C)) & \text{if } EL_F < EL_{tw} \\ \gamma_{soilm}\cdot \max(0, EL_F - EL_{tw}) + (\gamma_{soilsat} - \gamma_w)\cdot \max(EL_{tw} - EL_C, 0) & \text{otherwise} \end{cases}$$

$$W_{soil\_t} = 5 \cdot kN$$

Resultant location $x_{s\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

$y_{s\_t} := 0.5(EL_F - EL_C) + t_{base} = 0.67 \cdot m$

Moment about Toe $M_{soilw\_t} := W_{soil\_t} \cdot x_{s\_t} = 1.9 \cdot kN \cdot m$

7.5 Weight of Water on Toe

Weight of Water on toe $W_{w\_t} := \gamma_w \cdot \max[0kip, (EL_{tw} - EL_C)] \cdot L_{toe} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

$y_{w\_t} := 0.5(EL_{tw} - EL_C) + t_{base} = 0.5 \cdot m$

Moment about Toe $M_{w\_t} := W_{w\_t} \cdot x_{w\_t} = 0 \cdot kN \cdot m$

7.6 Weight of Soil under Footing and Above Failure Plane EJ

Depth of Soil Wedge Near Key $h_{s\_under} := (x_L - x_E) \cdot \frac{h_{key}}{L_{base}} = 1.29\,m$

Length of Soil Wedge $L_{s\_under} := x_L - x_E = 2.8\,m$

Weight of Soil Wedge Under Footing $W_{s\_under} := \gamma_{soilsat} \cdot (0.5 \cdot h_{s\_under} \cdot L_{s\_under}) \cdot b = 36.18 \cdot kN$

Resultant location $x_{s\_under} := \frac{2}{3}(x_L - x_E) = 1.87 \cdot m$

$y_{s\_under} := \frac{1}{3} h_{key} = 0.5 \cdot m$

Moment about Toe $M_{s\_under} := W_{s\_under} \cdot x_{s\_under} = 67.5 \cdot kN \cdot m$

7.7 Seismic Inertial Moments from Gravity Loads

Concrete

Due to vertical component $M_{Ev\_conc} := k_v \cdot W_{conc} \cdot x_{conc} = -4.32 \cdot kN \cdot m$

Due to horizontal component $M_{Eh\_conc} := k_h \cdot W_{conc} \cdot y_{conc} = 13.76 \cdot kN \cdot m$

Soils on Heel

Due to vertical component $M_{Ev\_soilw\_h} := k_v \cdot W_{soil\_h} \cdot x_{s\_h} = -7.42 \cdot kN \cdot m$

Due to horizontal component $M_{Eh\_soilw\_h} := k_h \cdot W_{soil\_h} \cdot y_{s\_h} = 39.19 \cdot kN \cdot m$

Soils on Toe

Due to vertical component $M_{Ev\_soilw\_t} := k_v \cdot W_{soil\_t} \cdot x_{s\_t} = -0.06 \cdot kN \cdot m$

Due to horizontal component $M_{Eh\_soilw\_t} := k_h \cdot W_{soil\_t} \cdot y_{s\_t} = 0.63 \cdot kN \cdot m$

Soil Under Base

Due to vertical component $M_{Ev\_s\_under} := k_v \cdot W_{s\_under} \cdot x_{s\_under} = -2.03 \cdot kN \cdot m$

Due to horizontal component $M_{Eh\_s\_under} := k_h \cdot W_{s\_under} \cdot (-y_{s\_under}) = -3.44 \cdot kN \cdot m$

Water on Heel

Due to vertical component $M_{Ev\_w\_h} := k_v \cdot W_{w\_h} \cdot x_{w\_h} = 0 \cdot kN \cdot m$

Due to horizontal component $M_{Eh\_w\_h} := k_h \cdot W_{w\_h} \cdot y_{w\_h} = 0 \cdot kN \cdot m$

Water on Toe

Due to vertical component $M_{Ev\_w\_t} := k_v \cdot W_{w\_t} \cdot x_{w\_t} = 0 \cdot kN \cdot m$

Due to horizontal component $M_{Eh\_w\_t} := k_h \cdot W_{w\_t} \cdot y_{w\_t} = 0 \cdot kN \cdot m$

Total Moment due to Horizontal Seismic Coefficient:

$$M_{EQ\_h} := M_{Eh\_conc} + M_{Eh\_soilw\_h} + M_{Eh\_soilw\_t} + M_{Eh\_s\_under} + M_{Eh\_w\_h} + M_{Eh\_w\_t} = 50.14 \cdot kN \cdot m$$

Total Moment due to Vertical Seismic Coefficient:

$$M_{EQ\_v} := M_{Ev\_conc} + M_{Ev\_soilw\_h} + M_{Ev\_soilw\_t} + M_{Ev\_s\_under} + M_{Ev\_w\_h} + M_{Ev\_w\_t} = -13.83 \cdot kN \cdot m$$

Net Seismic Moment $M_{EQ} := M_{EQ\_v} - M_{EQ\_h} - M_{E\_soil\_h} + M_{E\_soil\_t} = -165.15 \cdot kN \cdot m$

8.0 Overturning Stability Assessment - See Figure 2

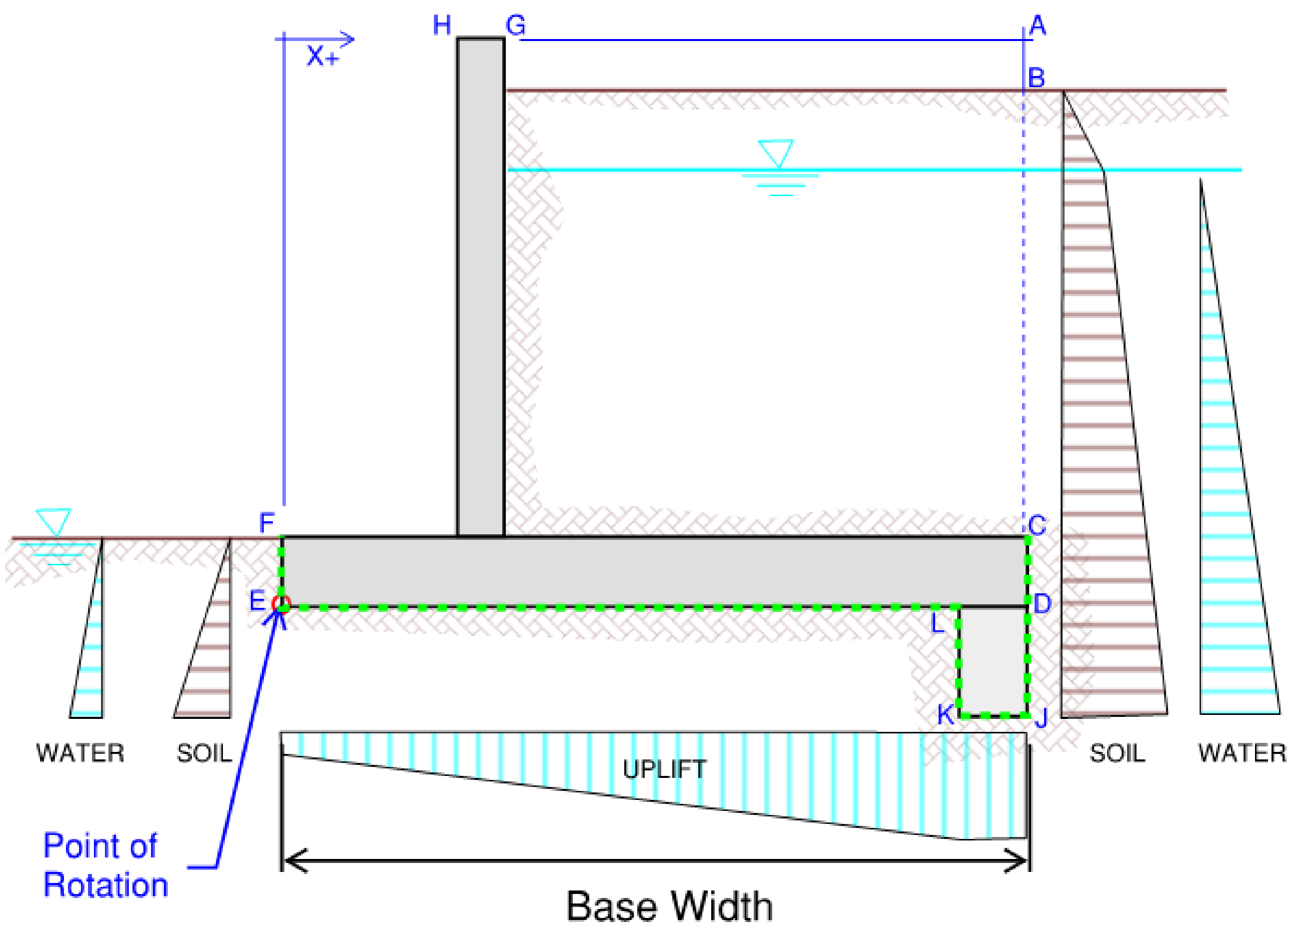

Figure 2. Free Body Diagram for Overturning Analysis

Uplift loads for Overturning

$$P_{u\_ot} := \left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]\cdot b = 43.16\cdot kN$$

Uplift resultant location

$$x_{u\_ot} := \frac{\left[\left[\frac{x_L - x_E}{2} + \frac{x_L - x_E}{6}\cdot\frac{\left(u_h - u_t\right)}{u_t + u_h}\right]\cdot\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right)\right] \cdots + \left(L_{base} - 0.5t_{key}\right)\cdot\left(u_h\cdot t_{key}\right)\right]}{\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]}$$

$$x_{u\_ot} = 1.96\,m$$

Uplift Moment about Toe

$$M_{u\_ot} := P_{u\_ot}\cdot x_{u\_ot} = 84.4\cdot kN\cdot m$$

Vertical Seismic Loads

$$EQ_v := k_v\cdot\left(W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}\right) = -6.09\cdot kN$$

Horizontal Seismic Loads

$$EQ_h := k_h\cdot\left(W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}\right) = 38.59\cdot kN$$

Total Vertical Forces

$$\Sigma V_{ot} := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t} - P_{u\_ot} + EQ_v = 153.9\cdot kN$$

Total Horizontal Forces

$$\Sigma H_{ot} := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} \cdots + P_{E\_soil\_t} + P_{E\_soil\_h} + EQ_h = 220.17\cdot kN$$

Total Resisting Moments - Static

$$\Sigma M_{r\_ot} := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} = 393.5\cdot kN\cdot m$$

Total Driving Moments - Static

$$\Sigma M_{d\_ot} := M_{hw} + M_{soil\_h} + M_{sur} + M_{u\_ot} \cdots + M_{tw} + M_{soil\_t} = 118.9\cdot kN\cdot m$$

Resultant Location from Toe

$$x_{r\_ot} := \frac{\Sigma M_{r\_ot} - \Sigma M_{d\_ot} + M_{EQ}}{\Sigma V_{ot}} = 0.71\cdot m$$

Normalized Resultant Location

$$\frac{x_{r\_ot}}{L_{base}} = 0.219$$

Eccentricity

$$e_{x\_ot} := \frac{L_{base}}{2} - x_{r\_ot} = 0.91\cdot m$$

Approx. Base in Compression $l_{comp\_ot} := \min\left[L_{base}, \frac{3}{2}\cdot\left(L_{base} - 2\cdot e_{x\_ot}\right)\right] = 2.13\cdot m$

Percent Base in Compression $Base\_Comp := \left(\frac{l_{comp\_ot}}{L_{base}}\right) = 65.7\cdot\%$

Resultant Location Check $check_{res} := if\left(Base\_Comp \geq Base\_Comp_{Req}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

9.0 Flotation Stability Assessment - See Figure 2

Calculated Flotation Safety Factor $FS_f := \frac{W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t} + EQ_v}{P_{u\_ot}} = 4.6$

Flotation Stability Check $check_{floatation} := if\left(FS_f \geq FS_{float}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

10.0 Sliding Stability Assessment - See Figure 3

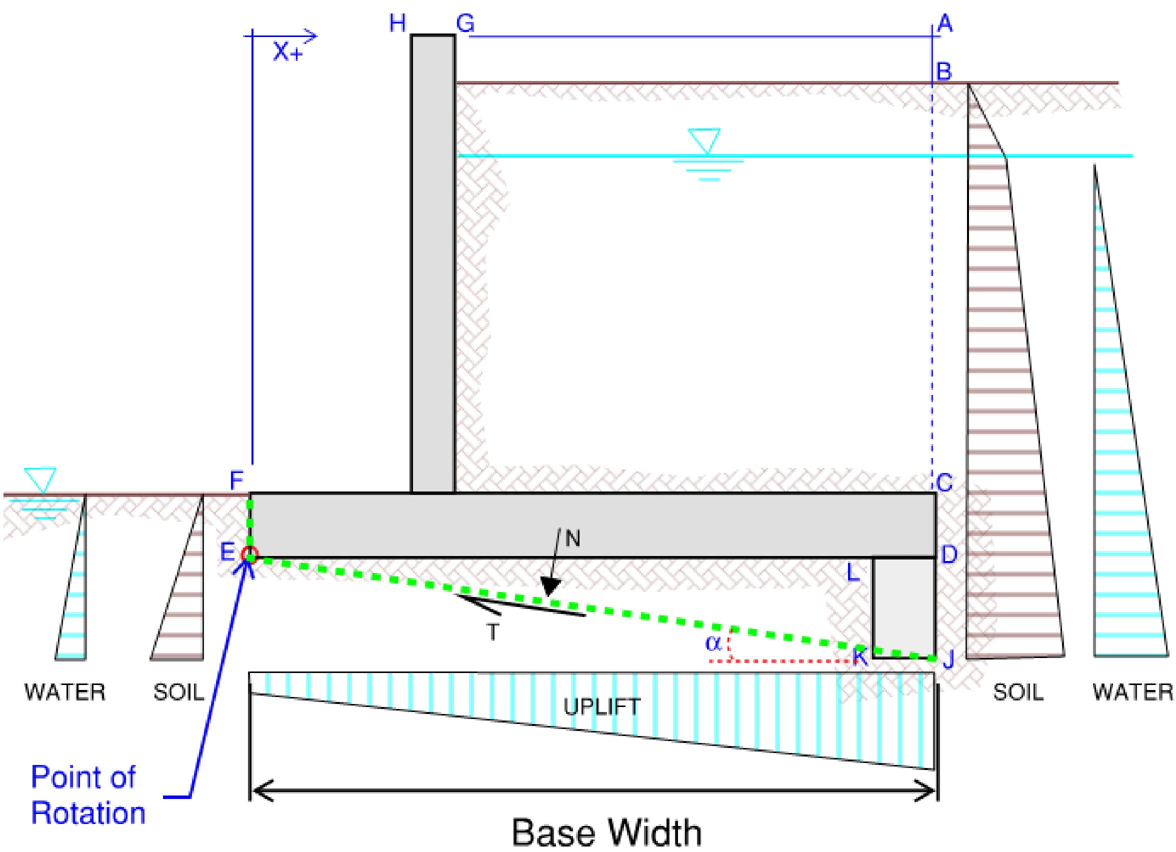

Figure 3. Free Body Diagram for Sliding Analysis

Length of Sliding Failure Plane, EJ $L_{fp} := \sqrt{L_{base}^{\,2} + h_{key}^{\,2}} = 3.58\,m$

Angle of Sliding Failure Plane From Horizontal $\alpha := \operatorname{atan}\left(\frac{h_{key}}{L_{base}}\right) = 24.8\cdot deg$

Total Vertical Forces $\Sigma V := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{s\_under} + W_{w\_t} - P_u + EQ_v = 193.4\cdot kN$

Total Horizontal Forces $\Sigma H := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} + EQ_h = 140.16\cdot kN$

Total Resisting Moments - Static $\Sigma M_r := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} + M_{s\_under} = 461\ m\cdot kN$

Total Driving Moments - Static $\Sigma M_d := M_{hw} + M_{soil\_h} + M_{sur} + M_u \cdots + M_{tw} + M_{soil\_t} = 112.2\cdot kN\cdot m$

Normal Force on Sliding Failure Plane: $N_s := \Sigma H\cdot \sin(\alpha) + \Sigma V\cdot \cos(\alpha) = 234.3\cdot kN$

Tangential Force on Sliding Failure Plane: $T_s := \Sigma H\cdot \cos(\alpha) - \Sigma V\cdot \sin(\alpha) = 46.23\cdot kN$

Calculated Sliding Safety Factor $\boxed{FS_s := \frac{N_s\cdot \tan(0.95\phi_{soil})}{T_s} = 2.13}$

Sliding Stability Check $check_{sliding} := if\left(FS_s \ge FS_{Sliding}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

11.0 Bearing Capacity Assessment

Resultant Location from Toe $x_r := \frac{\Sigma M_r - \Sigma M_d + M_{EQ}}{N_s} = 0.78\cdot m$

Eccentricity of N_s from center of base $e_s := \frac{L_{fp}}{2} - x_r = 1.01\cdot m$

Approx. Base in Compression $l_{comp.s} := \min\left[L_{fp}, \frac{3}{2}\cdot\left(L_{fp} - 2\cdot e_s\right)\right] = 2.35\cdot m$

Updated Eccentricity $e_x := \frac{l_{comp.s} - L_{fp}}{2} + e_s = 0.39\cdot m$

Effective base pressure at Toe $q_t := \left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 + \frac{6 \cdot e_x}{l_{comp.s}}\right) = 199.23 \cdot kPa$

Effective base pressure at Heel $q_h := \max\left[\left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 - \frac{6 \cdot e_x}{l_{comp.s}}\right), 0\right] = 0.00 \cdot kPa$

Calculated Bearing Safety Factor $FS_b := \frac{Q_b}{\max(q_t, q_h)} = 2.26$

Bearing Pressure Check $check_{bearing} := if\left(FS_b \geq FS_{Bearing}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$

12.0 Summary of Stability Assessments

Base Compression / Resultant Location $Base\_Comp = 65.7 \cdot \%$

Flotation Stability $FS_f = 4.6$

Sliding Stability $FS_s = 2.1$

Bearing Pressure $FS_b = 2.3$

STABILITY ANALYSIS FOR CANTILEVER WALL WITH KEY

Project / Client: Springbank Off-Stream Storage (SR1) / Alberta Transportation

Section Location: Intake Structure Wing Wall - Closest to Intake Structure

1.0 OBJECTIVE

For a particular load condition, analyze a reinforced concrete cantilever wall with shear key for overturning, sliding, flotation, and bearing capacity in accordance with criteria described in the listed references.

2.0 BACKGROUND INFORMATION

2.1 DATA SOURCES

1- Soils Report - Recommended Geotechnical Soil Parameters, SR-1 Low Level Outlet (LLO) Structures. July 19, 2019

2- Drawings - Design Drawings

3- Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM) , 2019

2.2 REFERENCES

1. (CDA) Dam Safety Guidelines, 2007 (revised 2013).
2. "Water Control Structures Selected Design Guidelines," Alberta Transportation & Alberta Environment, Calgary Alberta, November 2004.

3.0 DESIGN PARAMETERS AND CRITERIA

3.1 Stability Analysis Criteria (Data source 2)

Load Case	$LC := 5$
Load Case Description	$\text{vlookup}(LC, CASES, 1)_0 = \text{"Post Earthquake"}$
Sliding Minimum Factor of Safety	$FS_{Sliding} := \text{vlookup}(LC, CASES, 2)_0 = 1.1$
Overturning Criteria	$Base\_Comp_{Req} := \text{vlookup}(LC, CASES, 3)_0 = 0.1 \cdot \%$
Bearing Capacity Minimum Factor of Safety	$FS_{Bearing} := \text{vlookup}(LC, CASES, 4)_0 = 1$
Flotation Minimum Factor of Safety	$FS_{float} := \text{vlookup}(LC, CASES, 5)_0 = 1.1$

3.2 Material Properties - Data Source 1 Unless Otherwise Noted

Unit Weight of Water	$\gamma_w := 9.81 \frac{kN}{m^3}$	
Unit Weight of Concrete	$\gamma_c := 23.5 \cdot \frac{kN}{m^3}$	Data Source 3
Unit Weight of Soil (Moist)	$\gamma_{soilm} := 20 \frac{kN}{m^3}$	
Soil Unit Weight Beneath Base (Saturated)	$\gamma_{soilsat} := 20 \frac{kN}{m^3}$	
Soil Cohesion - Drained	$c_{soil} := 0kPa$	
Soil Angle of Internal Friction - Drained	$\phi_{soil} := 24deg$	
Soil Allowable Bearing Pressure	$Q_b := 150kPa$	
Slope of backfill (Conservative)	$\beta := 0$	
At-rest lateral earth pressure coefficient	$k_o := 1 - \sin(\phi_{soil}) = 0.59$	

4.0 WALL SECTION DESCRIPTION

4.1 Point Locations (Refer to Figure 1 and Drawings)

A - Top of wall	$EL_A := 1189.9m$	$x_A := 3.25m$
B - Top of fill - reservoir side	$EL_B := 1189.75m$	$x_B := x_A = 3.25 \cdot m$
C - Top of Heel	$EL_C := 1187m$	$x_C := x_A = 3.25 \cdot m$
D - Heel side end of footing	$EL_D := EL_C - 500mm = 1186.50\ m$	$x_D := x_A = 3.25 \cdot m$
E - Toe side end of footing	$EL_E := EL_D = 1186.50 \cdot m$	$x_E := 0m$
F - Top of Fill - land side	$EL_F := EL_C + 0.333m = 1187.33 \cdot m$	$x_F := x_E = 0$
G - Heel side face of wall stem	$EL_G := EL_A = 1189.90 \cdot m$	$x_G := 1.25m$
H - Toe side face of wall stem	$EL_H := EL_A = 1189.90 \cdot m$	$x_H := x_G - 0.500m = 0.75 \cdot m$

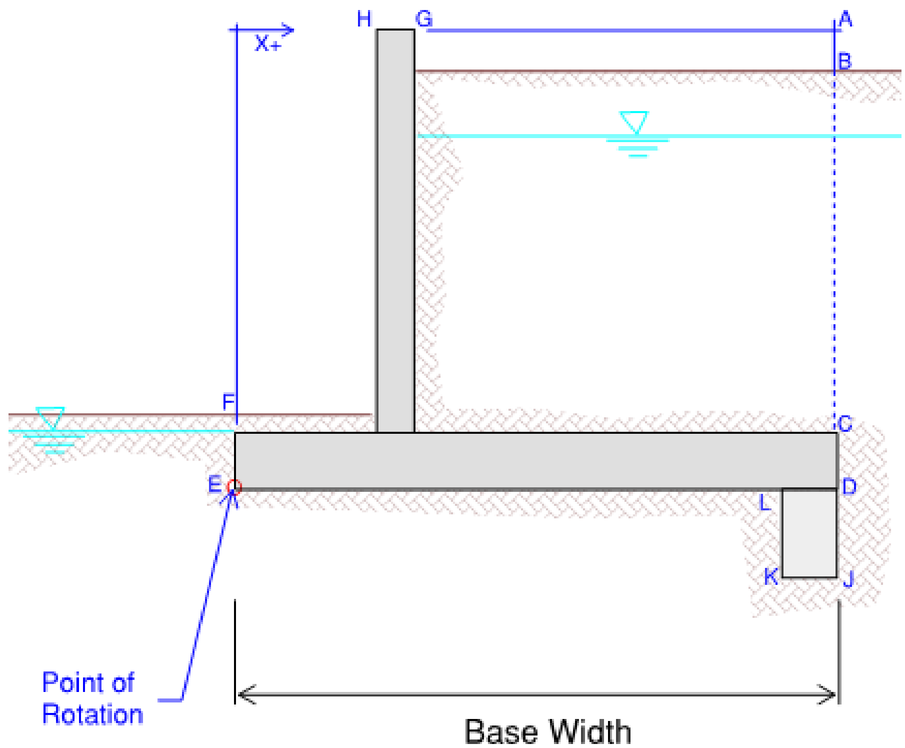

Figure 1. Cantilever Wall Section

J - Bottom of key - heel side $EL_J := EL_C - 2m = 1185.00 \cdot m$ $x_J := x_D = 3.25\,m$

K - Bottom of key - toe side $EL_K := EL_J = 1185.00 \cdot m$ $x_K := x_J - 450mm = 2.8 \cdot m$

L - Top of key $EL_L := EL_D = 1186.50 \cdot m$ $x_L := x_K = 2.8\,m$

Applied Loads Data Source 2

Heel side water elevation

$$EL_{hw} := \begin{cases} EL_B & \text{if } LC = 3 \\ (\text{vlookup}(LC, WaterEL, 1)_0 \cdot 1m) & \text{otherwise} \end{cases} = 1187$$

Toe side water elevation

$$EL_{tw} := \begin{cases} EL_F & \text{if } LC = 3 \\ (\text{vlookup}(LC, WaterEL, 2)_0 \cdot 1m) & \text{otherwise} \end{cases} = 1187$$

Equivalent soil surcharge:

$$h_{sur} := \begin{cases} 1.0m & \text{if } LC = 2 \\ 0 & \text{otherwise} \end{cases} = 0 \cdot m$$

4.2 Additional Analysis Dimensions

Analysis Width	$b := 1m$
Length of base	$L_{base} := (x_D - x_E) \cdot 0.657 = 2.14 \cdot m$
Thickness of base	$t_{base} := EL_C - EL_D = 500 \cdot mm$
Length of stem	$L_{stem} := EL_A - EL_C = 2.9 \cdot m$
Thickness of stem	$t_{stem} := x_G - x_H = 500 \cdot mm$
Length of Heel	$L_{heel} := x_A - x_G = 2000 \cdot mm$
Length of Toe	$L_{toe} := x_H - x_F = 750 \cdot mm$
Thickness of Key	$t_{key} := x_J - x_K = 450 \cdot mm$
Height of Key	$h_{key} := EL_D - EL_J = 1500 \cdot mm$

5.0 UPLIFT & HYDROSTATIC LOADS

5.1 Uplift Pressures for Stability Analyses

Determine water pressures for designated coordinates using full headwater uplift pressure at the heel and full tailwater uplift pressure at the toe. Uplift distribution is assumed linear from heel to toe.

Hydrostatic pressure at Heel	$u_h := \gamma_w \cdot (EL_{hw} - EL_J) = 20 \cdot kPa$
Hydrostatic pressure at Toe	$u_t := \gamma_w \cdot (EL_{tw} - EL_E) = 5 \cdot kPa$
Total uplift loads on base	$P_u := \frac{(u_h + u_t)}{2} \cdot L_{base} \cdot b = 26.18 \cdot kN$
Uplift resultant location	$x_u := \frac{L_{base}}{2} + \frac{L_{base}}{6} \cdot \frac{(u_h - u_t)}{u_t + u_h} = 1.28 \cdot m$
Uplift Moment about Toe	$M_u := P_u \cdot x_u = 33.5 \cdot kN \cdot m$

5.2 Headwater Hydrostatic Load - Heel Side

Headwater hydrostatic load $P_{hw} := \frac{1}{2} u_h \cdot (EL_{hw} - EL_J) \cdot b = 19.6 \cdot kN$

Headwater moment arm $y_{hw} := \frac{1}{3}(EL_{hw} - EL_J) - h_{key} = -0.83 \cdot m$

Headwater Moment about Toe $M_{hw} := P_{hw} \cdot y_{hw} = -16.4 \cdot kN \cdot m$

5.3 Tailwater Hydrostatic Load - Toe Side

Tailwater hydrostatic load $P_{tw} := \frac{1}{2} \gamma_w \cdot (EL_{tw} - EL_K)^2 \cdot b = 19.62 \cdot kN$

Tailwater moment arm $y_{tw} := h_{key} - \frac{1}{3}(EL_{tw} - EL_K) = 0.83 \cdot m$

Tailwater Moment about Toe $M_{tw} := P_{tw} \cdot y_{tw} = 16.35 \cdot kN \cdot m$

6.0 LATERAL EARTH PRESSURE

6.1 Lateral Soil Load on Toe Side

Soil pressure at Saturation Level

$$p_{tw} := \begin{vmatrix} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) \text{ if } EL_F > EL_{tw} \\ 0psf \text{ otherwise} \end{vmatrix} = 4.0 \cdot kPa$$

Soil pressure at Toe - base elevation

$$p_E := \begin{vmatrix} p_{tw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_J) \text{ if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_J) \text{ otherwise} \end{vmatrix}$$

$$p_E = 16.04 \cdot kPa$$

Total soil loads on Wall

$$P_{soil\_t} := \begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} + p_{tw} \cdot (EL_{tw} - EL_J) \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J) \end{bmatrix} \cdot b = 20.65 \cdot kN$$

Resultant location

$$y_{soil\_t} := \begin{vmatrix} 0 \text{ if } P_{soil\_t} = 0 \\ h_{key} - \dfrac{\begin{bmatrix} 0.5 \cdot (EL_F - EL_{tw}) \cdot p_{tw} \cdot \left[(EL_{tw} - EL_J) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_{tw} \cdot \frac{1}{2}(EL_{tw} - EL_J)^2 \ldots \\ + 0.5 \cdot (p_E - p_{tw}) \cdot (EL_{tw} - EL_J)^2 \cdot \frac{1}{3} \end{bmatrix} \cdot b}{P_{soil\_t}} \text{ otherwise} \end{vmatrix}$$

$$y_{soil\_t} = 0.66 \cdot m$$

Moment about Toe $M_{soil\_t} := P_{soil\_t} \cdot y_{soil\_t} = 13.62 \cdot kN \cdot m$

6.2 Lateral Soil Load on Heel Side

Soil pressure at Saturation Level
$$p_{hw} := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0psf & \text{otherwise} \end{cases} = 32.6 \cdot kPa$$

Soil pressure at Heel - base elevation
$$p_D := \begin{cases} p_{hw} + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_J) & \text{if } EL_B > EL_{hw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_J) & \text{otherwise} \end{cases}$$

$$p_D = 44.72 \cdot kPa$$

Total soil loads on Base
$$P_{soil\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} + p_{hw} \cdot (EL_{hw} - EL_J) \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J) \right] \cdot b$$

$$P_{soil\_h} = 122.22 \cdot kN$$

Resultant location
$$y_{soil\_h} := \frac{\left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_{hw} \cdot \left[EL_{hw} - EL_J + \frac{1}{3} (EL_B - EL_{hw}) \right] + p_{hw} \cdot \frac{1}{2} (EL_{hw} - EL_J)^2 \ldots + 0.5 \cdot (p_D - p_{hw}) \cdot (EL_{hw} - EL_J)^2 \cdot \frac{1}{3} \right] \cdot b}{P_{soil\_h}} - h_{key}$$

$$y_{soil\_h} = 0.17 \cdot m$$

Moment about Toe $M_{soil\_h} := P_{soil\_h} \cdot y_{soil\_h} = 20.9 \cdot kN \cdot m$

6.3 Surcharge Soil Load - Heel Side

Surcharge soil pressure $p_{sur} := k_o \cdot \gamma_{soilm} \cdot h_{sur} = 0 \cdot kPa$

Soil load on wall $P_{sur} := p_{sur} \cdot (EL_B - EL_J) \cdot b = 0 \cdot kN$

Resultant location $y_{sur} := \frac{1}{2} \cdot (EL_B - EL_J) - h_{key} = 0.88\, m$

Moment about Toe $M_{sur} := P_{sur} \cdot y_{sur} = 0 \cdot kN \cdot m$

7.0 GRAVITY LOADS

7.1 Weight of Concrete

Weight of Wall footing/base $W_{conc} := \gamma_c \cdot (t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}) \cdot b = 75.03 \cdot kN$

Resultant location $$x_{conc} := \frac{\left[\begin{array}{l}\frac{1}{2} t_{base} \cdot L_{base}^{\ 2} + L_{stem} \cdot t_{stem} \cdot (L_{toe} + 0.5 t_{stem}) \ ... \\ + t_{key} \cdot h_{key} \cdot (L_{base} - 0.5 t_{key})\end{array}\right]}{t_{base} \cdot L_{base} + L_{stem} \cdot t_{stem} + t_{key} \cdot h_{key}} = 1.22\,m$$

Moment about Toe $M_{conc} := W_{conc} \cdot x_{conc} = 91.16 \cdot kN \cdot m$

7.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{soil\_h} := b \cdot L_{heel} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{if } EL_B < EL_{hw} \\ \gamma_{soilm} \cdot (EL_B - EL_{hw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max[0, (EL_{hw} - EL_C)] & \text{otherwise} \end{array} \right.$$

$W_{soil\_h} = 110 \cdot kN$

Resultant location $x_{soil\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{soilw\_h} := W_{soil\_h} \cdot x_{soil\_h} = 247.5 \cdot kN \cdot m$

7.3 Weight of Water on Heel

Weight of Water on heel $W_{w\_h} := \gamma_w \cdot \max[0kip, (EL_{hw} - EL_C)] \cdot L_{heel} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_h} := 0.5(x_B - x_G) + x_G = 2.25 \cdot m$

Moment about Toe $M_{w\_h} := W_{w\_h} \cdot x_{w\_h} = 0 \cdot kN \cdot m$

7.4 Weight of Soil on Toe

Weight of Soil on toe Note: Water and soil elevations MUST NOT be below footing elevation

$$W_{soil\_t} := b \cdot L_{toe} \cdot \left| \begin{array}{ll} (\gamma_{soilsat} - \gamma_w) \cdot (\max(0, EL_F - EL_C)) & \text{if } EL_F < EL_{tw} \\ \gamma_{soilm} \cdot \max(0, EL_F - EL_{tw}) + (\gamma_{soilsat} - \gamma_w) \cdot \max(EL_{tw} - EL_C, 0) & \text{otherwise} \end{array} \right.$$

$W_{soil\_t} = 5 \cdot kN$

Resultant location $x_{soil\_t} := 0.5(x_H - x_E) = 0.38 \cdot m$

Moment about Toe $M_{soilw\_t} := W_{soil\_t} \cdot x_{soil\_t} = 1.9 \cdot kN \cdot m$

7.5 Weight of Water on Toe

Weight of Water on toe $W_{w\_t} := \gamma_w \cdot \max\left[0kip, \left(EL_{tw} - EL_C\right)\right] \cdot L_{toe} \cdot b = 0 \cdot kN$

Resultant location $x_{w\_t} := 0.5\left(x_H - x_E\right) = 0.38 \cdot m$

Moment about Toe $M_{w\_t} := W_{w\_t} \cdot x_{w\_t} = 0 \cdot kN \cdot m$

7.6 Weight of Soil under Footing and Above Failure Plane EJ

Depth of Soil Wedge Near Key $h_{s\_under} := \left(x_L - x_E\right) \cdot \dfrac{h_{key}}{L_{base}} = 1.97\,m$

Length of Soil Wedge $L_{s\_under} := x_L - x_E = 2.8\,m$

Weight of Soil Wedge Under Footing $W_{s\_under} := \gamma_{soilsat} \cdot \left(0.5 \cdot h_{s\_under} \cdot L_{s\_under}\right) \cdot b = 55.08 \cdot kN$

Resultant location $x_{s\_under} := \dfrac{2}{3}\left(x_L - x_E\right) = 1.87 \cdot m$

Moment about Toe $M_{s\_under} := W_{s\_under} \cdot x_{s\_under} = 102.8 \cdot kN \cdot m$

8.0 Overturning Stability Assessment - See Figure 2

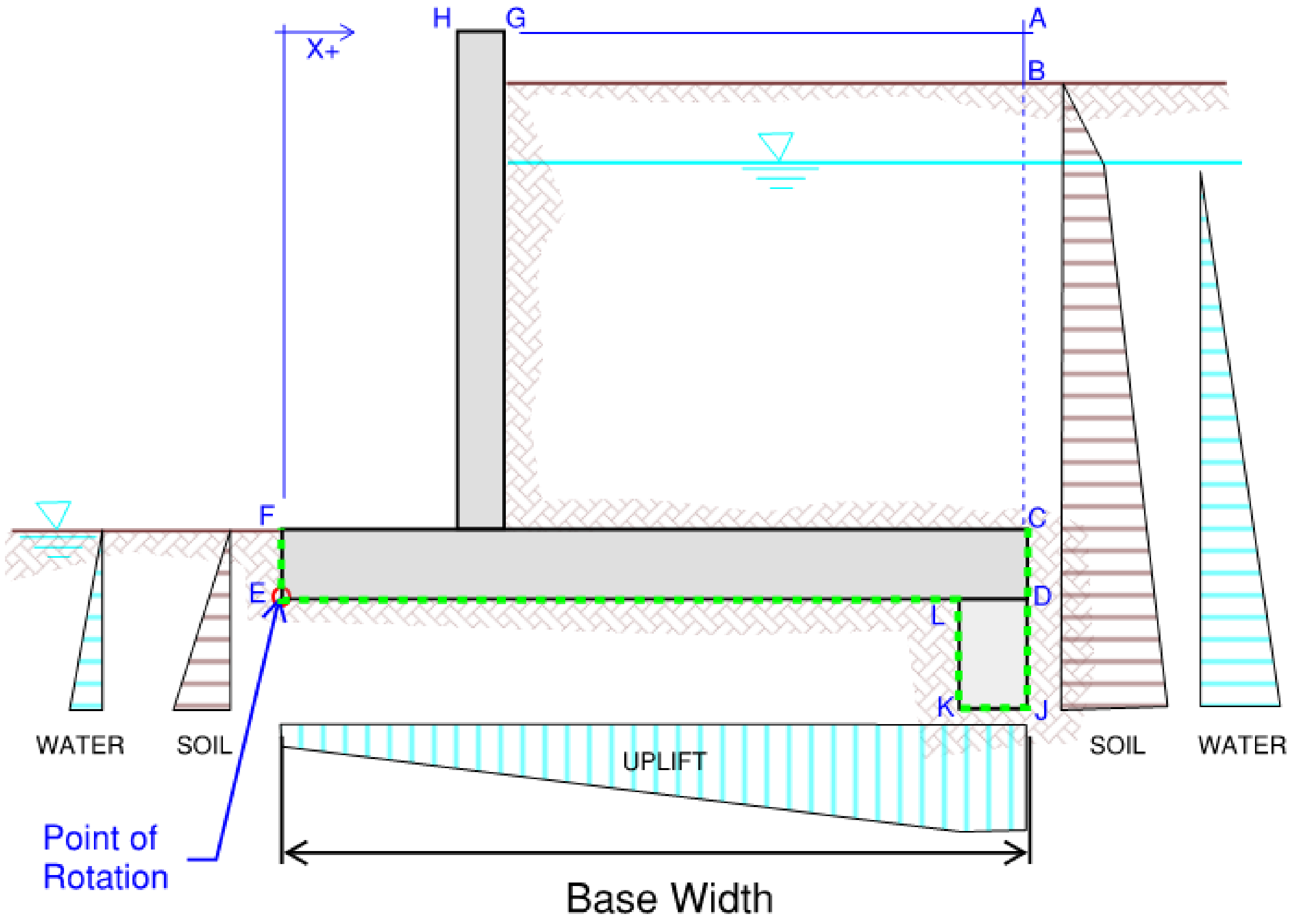

Figure 2. Free Body Diagram for Overturning Analysis

Uplift loads for Overturning

$$P_{u\_ot} := \left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]\cdot b = 43.16\cdot kN$$

Uplift resultant location

$$x_{u\_ot} := \frac{\left[\left[\frac{x_L - x_E}{2} + \frac{x_L - x_E}{6}\cdot\frac{\left(u_h - u_t\right)}{u_t + u_h}\right]\cdot\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right)\right] \ldots \\ + \left(L_{base} - 0.5t_{key}\right)\cdot\left(u_h\cdot t_{key}\right)\right]}{\left[\frac{1}{2}\left(u_h + u_t\right)\cdot\left(x_L - x_E\right) + u_h\cdot t_{key}\right]}$$

$$x_{u\_ot} = 1.73\,m$$

Uplift Moment about Toe

$$M_{u\_ot} := P_{u\_ot}\cdot x_{u\_ot} = 74.5\cdot kN\cdot m$$

Total Vertical Forces

$$\Sigma V_{ot} := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t} - P_{u\_ot} = 146.9 \cdot kN$$

Total Horizontal Forces

$$\Sigma H_{ot} := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 101.56 \cdot kN$$

Total Resisting Moments

$$\Sigma M_{r\_ot} := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} = 340.5 \cdot kN \cdot m$$

Total Driving Moments

$$\Sigma M_{d\_ot} := M_{hw} + M_{soil\_h} + M_{sur} + M_{u\_ot} \cdots + M_{tw} + M_{soil\_t} = 109 \cdot kN \cdot m$$

Resultant Location from Toe

$$x_{r\_ot} := \frac{\Sigma M_{r\_ot} - \Sigma M_{d\_ot}}{\Sigma V_{ot}} = 1.58 \cdot m$$

Normalized Resultant Location

$$\frac{x_{r\_ot}}{L_{base}} = 0.738$$

Eccentricity

$$e_{x\_ot} := \frac{L_{base}}{2} - x_{r\_ot} = -0.51 \cdot m$$

Approx. Base in Compression

$$l_{comp\_ot} := \min\left[L_{base}, \frac{3}{2} \cdot \left(L_{base} - 2 \cdot e_{x\_ot}\right)\right] = 2.14 \cdot m$$

Percent Base in Compression

$$\boxed{Base\_Comp := \left(\frac{l_{comp\_ot}}{L_{base}}\right) = 100 \cdot \%}$$

Resultant Location Check

$$check_{res} := if\left(Base\_Comp \geq Base\_Comp_{Req}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$$

9.0 Flotation Stability Assessment - See Figure 2

Calculated Flotation Safety Factor

$$\boxed{FS_f := \frac{W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{w\_t}}{P_{u\_ot}} = 4.4}$$

Flotation Stability Check

$$check_{floatation} := if\left(FS_f \geq FS_{float}, \text{"OK"}, \text{"NG"}\right) = \text{"OK"}$$

10.0 Sliding Stability Assessment - See Figure 3

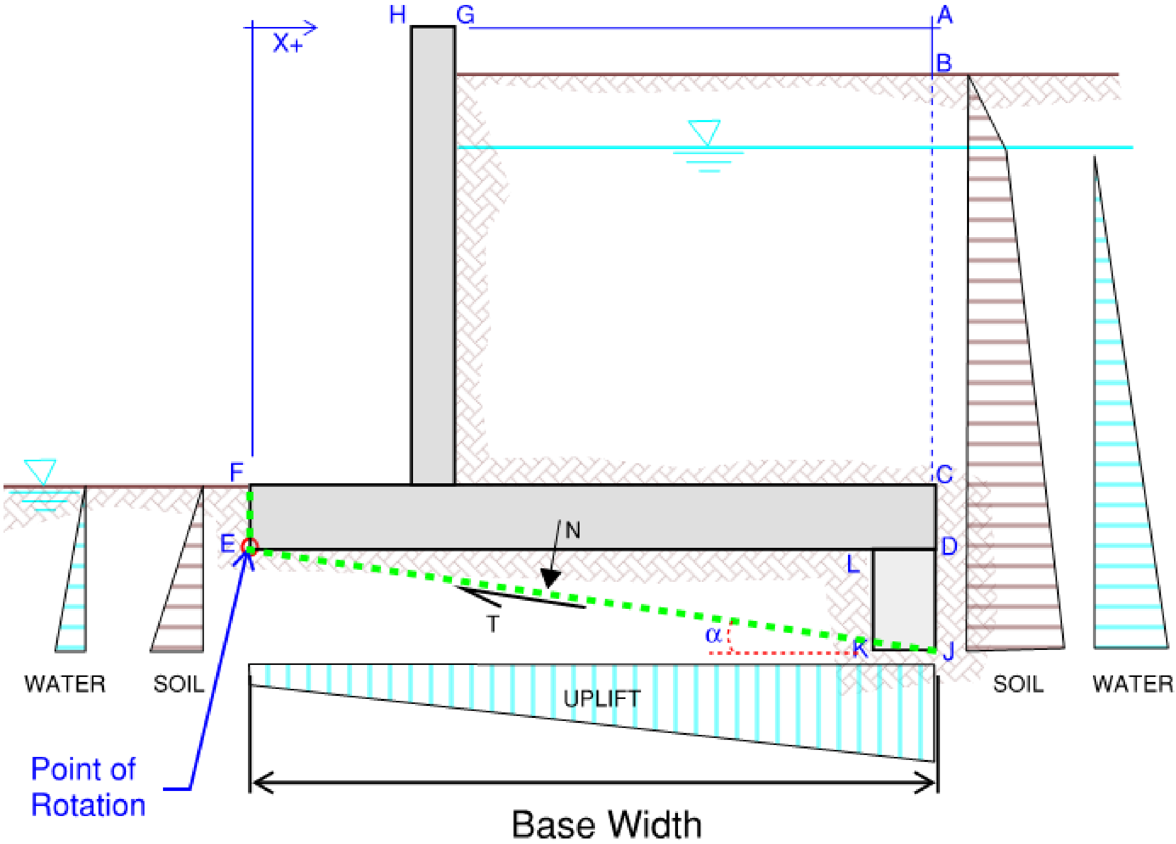

Figure 3. Free Body Diagram for Sliding Analysis

Length of Sliding Failure Plane, EJ $\quad L_{fp} := \sqrt{L_{base}^2 + h_{key}^2} = 2.61\ \text{m}$

Angle of Sliding Failure Plane From Horizontal $\quad \alpha := \operatorname{atan}\left(\frac{h_{key}}{L_{base}}\right) = 35.1 \cdot \text{deg}$

Total Vertical Forces $\quad \Sigma V := W_{conc} + W_{soil\_h} + W_{soil\_t} \cdots + W_{w\_h} + W_{s\_under} + W_{w\_t} - P_u = 218.9 \cdot \text{kN}$

Total Horizontal Forces $\quad \Sigma H := P_{hw} + P_{soil\_h} + P_{sur} - P_{tw} - P_{soil\_t} = 101.56 \cdot \text{kN}$

Total Resisting Moments $\quad \Sigma M_r := M_{conc} + M_{soilw\_h} + M_{w\_h} \cdots + M_{soilw\_t} + M_{w\_t} + M_{s\_under} = 443.3\ \text{m} \cdot \text{kN}$

Total Driving Moments $\quad \Sigma M_d := M_{hw} + M_{soil\_h} + M_{sur} + M_u \cdots + M_{tw} + M_{soil\_t} = 68 \cdot \text{kN} \cdot \text{m}$

Normal Force on Sliding Failure Plane: $N_s := \Sigma H \cdot \sin(\alpha) + \Sigma V \cdot \cos(\alpha) = 237.51 \cdot kN$

Tangential Force on Sliding Failure Plane: $T_s := \Sigma H \cdot \cos(\alpha) - \Sigma V \cdot \sin(\alpha) = -42.73 \cdot kN$

Calculated Sliding Safety Factor $\boxed{FS_s := \frac{\left|N_s \cdot \tan\left(0.95\phi_{soil}\right)\right|}{\left|T_s\right|} = 2.34}$

Sliding Stability Check $check_{sliding} := if\left(FS_s \geq FS_{Sliding}, "OK", "NG"\right) = "OK"$

11.0 Bearing Capacity Assessment

Resultant Location from Toe $x_r := \frac{\Sigma M_r - \Sigma M_d}{N_s} = 1.58 \cdot m$

Eccentricity of N_s from center of base $e_s := \frac{L_{fp}}{2} - x_r = -0.28 \cdot m$

Approx. Base in Compression $l_{comp.s} := \min\left[L_{fp}, \frac{3}{2} \cdot \left(L_{fp} - 2 \cdot e_s\right)\right] = 2.61 \cdot m$

Updated Eccentricity $e_x := \frac{l_{comp.s} - L_{fp}}{2} + e_s = -0.28 \cdot m$

Effective base pressure at Toe $q_t := \left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 + \frac{6 \cdot e_x}{l_{comp.s}}\right) = 33.37 \cdot kPa$

Effective base pressure at Heel $q_h := \max\left[\left(\frac{N_s}{l_{comp.s} \cdot b}\right) \cdot \left(1 - \frac{6 \cdot e_x}{l_{comp.s}}\right), 0\right] = 148.67 \cdot kPa$

Calculated Bearing Safety Factor $\boxed{FS_b := \frac{Q_b}{\max\left(q_t, q_h\right)} = 1.01}$

Bearing Pressure Check $check_{bearing} := if\left(FS_b \geq FS_{Bearing}, "OK", "NG"\right) = "OK"$

12.0 Summary of Stability Assessments

Base Compression / Resultant Location	$Base\_Comp = 100 \cdot \%$	$check_{res} = "OK"$
Flotation Stability	$FS_f = 4.4$	$check_{floatation} = "OK"$
Sliding Stability	$FS_s = 2.3$	$check_{sliding} = "OK"$
Bearing Pressure	$FS_b = 1.0$	$check_{bearing} = "OK"$

13.0 Structural Loads

13.1 Shear and Moment at Stem Base - See Figure 4

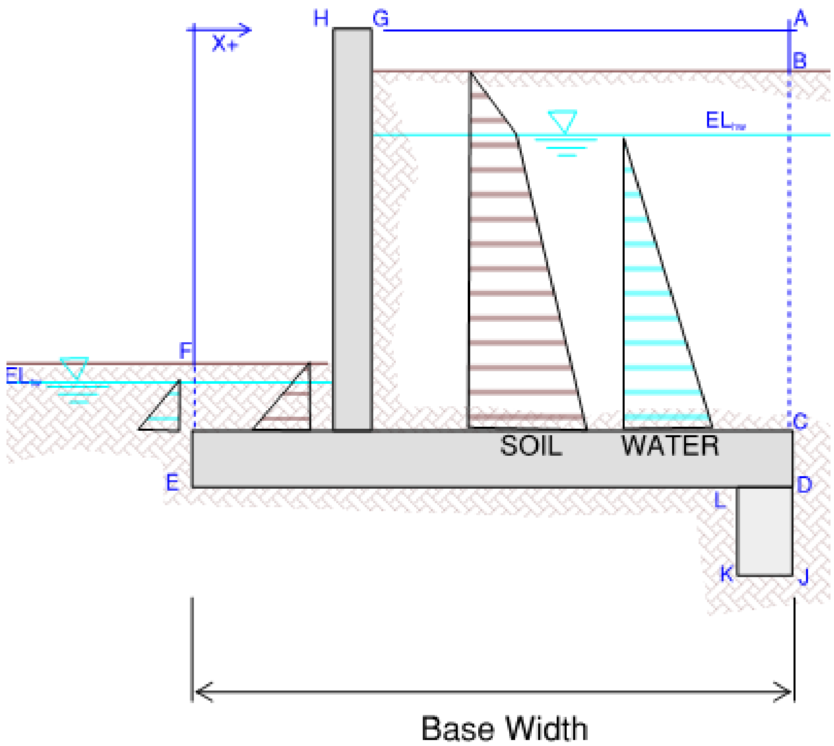

Figure 4 - Loads on Stem

13.1.1 Hydrostatic Load at Stem Base

Heel side hydrostatic load $P_{hw\_stem} := \frac{1}{2}\gamma_w \cdot \left(EL_{hw} - EL_C\right)^2 \cdot b = 0.0 \cdot kN$

Heel side moment at stem base $M_{hw\_stem} := P_{hw\_stem} \cdot \left(\frac{EL_{hw} - EL_C}{3}\right) = 0 \cdot kN \cdot m$

Toe side hydrostatic load $P_{tw\_stem} := \frac{1}{2}\gamma_w \cdot \left(EL_{tw} - EL_C\right)^2 \cdot b = 0.0 \cdot kN$

Toe side moment at stem base $M_{tw\_stem} := P_{tw\_stem} \cdot \left(\frac{EL_{tw} - EL_C}{3}\right) = 0 \cdot kN \cdot m$

13.1.2 Lateral Soil Loads at Stem Base

Soil pressure at saturation level - Toe Side

$$p_t := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_F - EL_{tw}) & \text{if } EL_F > EL_{tw} \\ 0psf & \text{otherwise} \end{cases} = 3.95 \cdot kPa$$

Soil pressure at stem base - Toe Side

$$p_{C.t} := \begin{cases} p_t + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{tw} - EL_C) & \text{if } EL_F > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_F - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.t} = 3.95 \cdot kPa$$

Lateral soil loads at stem base - Toe Side

$$P_{s\_t} := \left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t + p_t \cdot (EL_{tw} - EL_C) \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)\right] \cdot b = 0.66 \cdot kN$$

Resultant location

$$y_{s\_t} := \begin{cases} 0 & \text{if } P_{s\_t} = 0 \\ \dfrac{\left[0.5 \cdot (EL_F - EL_{tw}) \cdot p_t \cdot \left[(EL_{tw} - EL_C) + \frac{1}{3}(EL_F - EL_{tw})\right] + p_t \cdot \frac{1}{2}(EL_{tw} - EL_C)^2 \ldots + 0.5 \cdot (p_{C.t} - p_t) \cdot (EL_{tw} - EL_C)^2 \cdot \frac{1}{3}\right] \cdot b}{P_{s\_t}} & \text{otherwise} \end{cases}$$

$$y_{s\_t} = 0.11 \cdot m$$

Lateral soil moment at stem base - Toe Side

$$M_{s\_t} := P_{s\_t} \cdot y_{s\_t} = 0.07 \cdot kN \cdot m$$

Soil pressure at saturation level - Heel Side

$$p_h := \begin{cases} k_o \cdot \gamma_{soilm} \cdot (EL_B - EL_{hw}) & \text{if } EL_B > EL_{hw} \\ 0kPa & \text{otherwise} \end{cases} = 32.63 \cdot kPa$$

Soil pressure at stem base - Heel Side

$$p_{C.h} := \begin{cases} p_h + k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_{hw} - EL_C) & \text{if } EL_B > EL_{tw} \\ k_o \cdot (\gamma_{soilsat} - \gamma_w) \cdot (EL_B - EL_C) & \text{otherwise} \end{cases}$$

$$p_{C.h} = 32.63 \cdot kPa$$

Lateral soil loads at stem base - Heel Side

$$P_{s\_h} := \left[0.5 \cdot (EL_B - EL_{hw}) \cdot p_h + p_h \cdot (EL_{hw} - EL_C) \ldots + 0.5 \cdot (p_{C.h} - p_h) \cdot (EL_{hw} - EL_C)\right] \cdot b = 44.87 \cdot kN$$

Resultant location

$$y_{s\_h} := \begin{cases} 0 & \text{if } P_{s\_h} = 0 \\ \dfrac{\left[0.5\cdot\left(EL_B - EL_{hw}\right)\cdot p_h\cdot\left[\left(EL_{hw} - EL_C\right) + \frac{1}{3}\left(EL_B - EL_{hw}\right)\right] + p_h\cdot\frac{1}{2}\left(EL_{hw} - EL_C\right)^2 \ldots \\ + 0.5\cdot\left(p_{C.h} - p_h\right)\cdot\left(EL_{hw} - EL_C\right)^2\cdot\frac{1}{3}\right]\cdot b}{P_{s\_h}} & \text{otherwise} \end{cases}$$

$$y_{s\_h} = 0.92\cdot m$$

Lateral soil moment at stem base - Heel Side $M_{s\_h} := P_{s\_h}\cdot y_{s\_h} = 41.13\cdot kN\cdot m$

13.1.3 Surcharge Loads at Stem Base

Surcharge load at stem base $P_{sur\_stem} := p_{sur}\cdot\left(EL_B - EL_C\right)\cdot b = 0\cdot kN$

Surcharge Moment about Toe $M_{sur\_stem} := P_{sur}\cdot\frac{1}{2}\left(EL_B - EL_C\right) = 0\cdot kN\cdot m$

13.2 Shear and Moment on Heel - See Figure 5

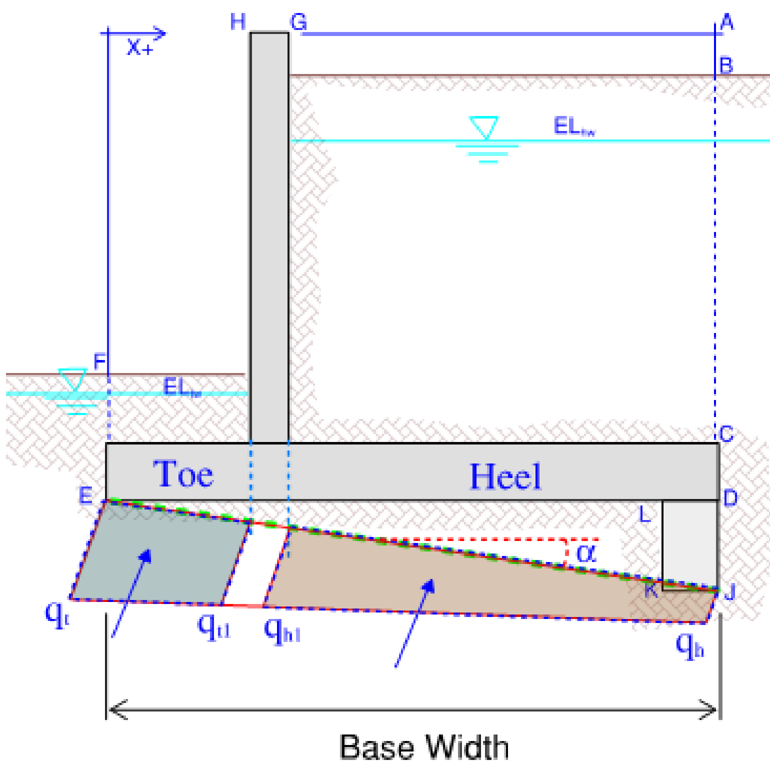

Figure 5 - Loads on Base (Heel & Toe)

13.2.1 Weight of Concrete Heel

Weight of Wall footing/base

$$W_{c\_heel} := \gamma_c \cdot \left(t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}\right) \cdot b = 39.36 \cdot kN$$

Resultant location

$$x_{c\_heel} := \frac{\left[\frac{1}{2} t_{base} \cdot L_{heel}^{\ 2} \ldots \atop + t_{key} \cdot h_{key} \cdot \left(L_{heel} - 0.5 t_{key}\right)\right]}{t_{base} \cdot L_{heel} + t_{key} \cdot h_{key}} = 1.31\ m$$

Moment about stem base

$$M_{c\_heel} := W_{c\_heel} \cdot x_{c\_heel} = 51.66 \cdot kN \cdot m$$

13.2.2 Weight of Soil on Heel

Weight of Soil on heel

$$W_{s\_heel} := W_{soil\_h} = 110 \cdot kN$$

Moment about stem base

$$M_{s\_heel} := W_{s\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 110 \cdot kN \cdot m$$

13.2.3 Weight of Water on Heel

Weight of Water on heel

$$W_{w\_heel} := W_{w\_h} = 0 \cdot kN$$

Moment about stem base

$$M_{w\_heel} := W_{w\_heel} \cdot \left(\frac{1}{2} L_{heel}\right) = 0 \cdot kN \cdot m$$

13.2.4 Weight of Concrete Toe

Weight of Wall footing/base

$$W_{c\_toe} := \gamma_c \cdot t_{base} \cdot L_{toe} \cdot b = 8.81 \cdot kN$$

Moment about stem base

$$M_{c\_toe} := W_{c\_toe} \cdot \left(\frac{1}{2} \cdot L_{toe}\right) = 3.3 \cdot kN \cdot m$$

13.2.5 Weight of Soil on Toe

Weight of Soil on Toe

$$W_{s\_toe} := W_{soil\_t} = 5 \cdot kN$$

Moment about stem base

$$M_{s\_toe} := W_{s\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 1.9 \cdot kN \cdot m$$

13.2.6 Weight of Water on Toe

Weight of Water on Toe

$$W_{w\_toe} := W_{w\_t} = 0 \cdot kN$$

Moment about stem base

$$M_{w\_toe} := W_{w\_toe} \cdot \left(\frac{1}{2} L_{toe}\right) = 0 \cdot kN \cdot m$$

13.2.7 Bearing Pressures on Footing

Approx. Base in Compression $l_{comp.s} = 2.61\,m$

Effective base pressure at Toe $q_t = 33.37 \cdot kPa$

Effective base pressure at Heel $q_h = 148.67 \cdot kPa$

Compression length under Toe $L_{bearing\_t} := \dfrac{L_{toe}}{\cos(\alpha)} = 0.92\,m$

Compression length under Heel $L_{bearing\_h} := l_{comp.s} - \dfrac{(x_G - x_E)}{\cos(\alpha)} = 1.08\,m$

Bearing pressure under toe side of stem $q_{t1} := L_{bearing\_t} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 73.87 \cdot kPa$

Bearing pressure under heel side of stem $q_{h1} := \dfrac{(x_G - x_E)}{\cos(\alpha)} \cdot \left[\dfrac{(q_h - q_t)}{l_{comp.s}}\right] + q_t = 100.87 \cdot kPa$

13.2.8 Soil Reaction on Heel

Soil reaction load on Heel $P_{bearing\_h} := \dfrac{1}{2} \cdot (q_h + q_{h1}) \cdot L_{bearing\_h} \cdot b = 134.98 \cdot kN$

Resultant location $x_{bearing\_h} := \dfrac{L_{bearing\_h}}{2} + \dfrac{L_{bearing\_h}}{6} \cdot \dfrac{(q_h - q_{h1})}{q_{h1} + q_h} = 0.58\,m$

Vertical Component $P_{h\_v} := P_{bearing\_h} \cdot \cos(\alpha) = 110.45 \cdot kN$

Horizontal Component $P_{h\_h} := P_{bearing\_h} \cdot \sin(\alpha) = 77.59 \cdot kN$

Horizontal Moment Arm $x_{h\_h} := x_{bearing\_h} \cdot \cos(\alpha) = 0.47\,m$

Vertical Moment Arm $y_{h\_v} := \left[\dfrac{(x_G - x_E)}{\cos(\alpha)} + x_{bearing\_h}\right] \cdot \sin(\alpha) = 1.21\,m$

Moment on Heel $M_{bearing\_h} := P_{h\_v} \cdot x_{h\_h} + P_{h\_h} \cdot y_{h\_v} = 145.81 \cdot kN \cdot m$

13.2.9 Soil Reaction on Toe

Soil reaction load on Toe $$P_{bearing\_t} := \frac{1}{2} \cdot (q_t + q_{t1}) \cdot L_{bearing\_t} \cdot b = 49.14 \cdot kN$$

Resultant location $$x_{bearing\_t} := \frac{L_{bearing\_t}}{2} + \frac{L_{bearing\_t}}{6} \cdot \frac{(q_t - q_{t1})}{q_t + q_{t1}} = 0.4\,m$$

Vertical Component $$P_{t\_v} := P_{bearing\_t} \cdot \cos(\alpha) = 40.21 \cdot kN$$

Horizontal Component $$P_{t\_h} := P_{bearing\_t} \cdot \sin(\alpha) = 28.25 \cdot kN$$

Horizontal Moment Arm $$x_{t\_h} := x_{bearing\_t} \cdot \cos(\alpha) = 0.33\,m$$

Vertical Moment Arm $$y_{t\_v} := (L_{bearing\_t} - x_{bearing\_t}) \cdot \sin(\alpha) = 0.3\,m$$

Moment on Toe $$M_{bearing\_t} := P_{t\_v} \cdot x_{t\_h} + P_{t\_h} \cdot y_{t\_v} = 21.56 \cdot kN \cdot m$$

13.2.10 Uplift Pressure on Footing - Figure 6

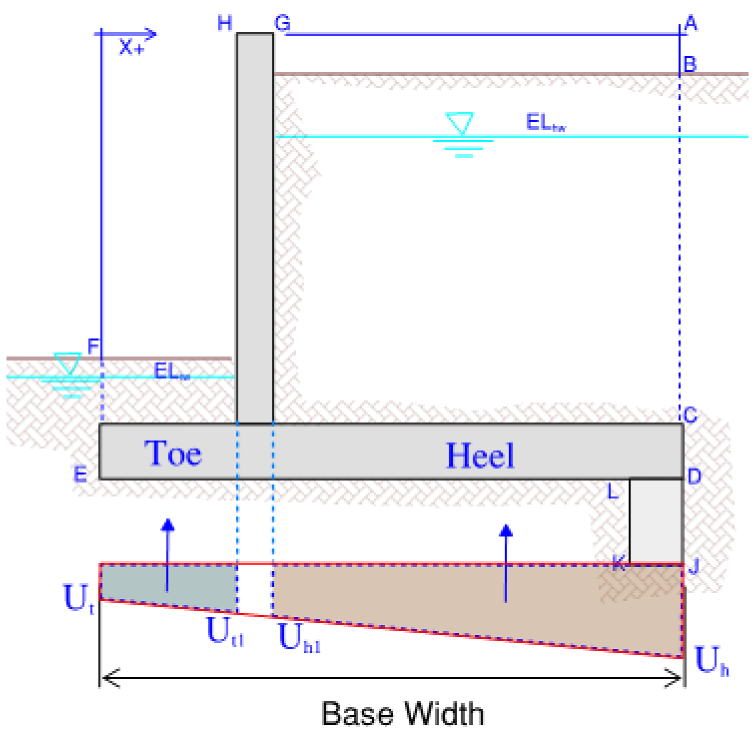

Figure 6 - Uplift Loads on Base (Heel & Toe)

Uplift pressure under toe side of stem $u_{t1} := L_{toe} \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 10.07 \cdot kPa$

Uplift pressure under heel side of stem $u_{h1} := (x_G - x_E) \cdot \left[\frac{(u_h - u_t)}{L_{base}}\right] + u_t = 13.52 \cdot kPa$

13.2.11 Uplift Loads Heel

Uplift load on Heel $P_{u\_h} := \frac{1}{2} \cdot (u_h + u_{h1}) \cdot L_{heel} \cdot b = 33.14 \cdot kN$

Moment Arm $x_{u\_h} := \frac{L_{heel}}{2} + \frac{L_{heel}}{6} \cdot \frac{(u_h - u_{h1})}{u_{h1} + u_h} = 1.06\,m$

Moment on Heel $M_{u\_h} := P_{u\_h} \cdot x_{u\_h} = 35.17 \cdot kN \cdot m$

13.2.12 Uplift Loads Toe

Uplift load on Toe $P_{u\_t} := \frac{1}{2} \cdot (u_t + u_{t1}) \cdot L_{toe} \cdot b = 5.62 \cdot kN$

Moment Arm $x_{u\_t} := \frac{L_{toe}}{2} + \frac{L_{toe}}{6} \cdot \frac{(u_t - u_{t1})}{u_{t1} + u_t} = 0.33\,m$

Moment on Toe $M_{u\_t} := P_{u\_t} \cdot x_{u\_t} = 1.86 \cdot kN \cdot m$

13.3 Structural Load Summary

Net shear at stem base $V_{stem} := P_{hw\_stem} - P_{tw\_stem} + P_{s\_h} - P_{s\_t} + P_{sur\_stem} = 44.2 \cdot kN$

Net moment at stem base $M_{stem} := M_{hw\_stem} - M_{tw\_stem} + M_{s\_h} - M_{s\_t} + M_{sur\_stem} = 41.1 \cdot kN \cdot m$

Net shear on Toe $V_t := W_{c\_toe} + W_{s\_toe} + W_{w\_toe} - P_{t\_v} - P_{u\_t} = -32 \cdot kN$

Net moment on Toe $M_t := M_{c\_toe} + M_{s\_toe} + M_{w\_toe} - M_{bearing\_t} - M_{u\_t} = -18.2 \cdot kN \cdot m$

Net shear on Heel $V_h := W_{c\_heel} + W_{s\_heel} + W_{w\_heel} - P_{h\_v} - P_{u\_h} = 5.8 \cdot kN$

Net moment on Heel $M_h := M_{c\_heel} + M_{s\_heel} + M_{w\_heel} - M_{bearing\_h} - M_{u\_h} = -19.3 \cdot kN \cdot m$

13.4 Controlling Structural Loads (Unfactored)

Stem cross section

$M_{stem} = 41.1 \cdot kN \cdot m$

$V_{stem} = 44.2 \cdot kN$

Toe cross section

$M_{toe} := M_t = -18.25 \cdot kN \cdot m$

$V_{toe} := V_t = -32 \cdot kN$

Heel cross section

$M_{heel} := \min\left(\max\left(M_{stem} - \left|M_{toe}\right|, M_h\right), M_{stem}\right) = 22.8 \cdot kN \cdot m$

APPENDIX E.5-2 GATE STRUCTURE

Appendix E.5-2 – Gate Structure Stability Calculations Springbank Off-Stream Storage/Alberta Transportation Table of Contents

Gate Structure - Model Input Calculations

LOAD CALCULATIONS - Snow and Wind Loads
SR1- Low Level Outlet Intake Tower

Source: 1. Alberta Building Code 2014, Volume 1

Objective: Estimate design wind and snow loads for the Gate Tower Structure at SR1.

1.0 Calculated Snow Load

- Importance category:	Post-Disaster	Table 4.1.2.1
- Importance factor for snow load:	$I_s := 1.25$	Table 4.1.6.2
- Basic roof snow load factor:	$C_b := 0.8$	4.1.6.2 (2)
- Wind exposure factor:	$C_w := 1.0$	4.1.6.2 (3)
- Slope factor:	$C_s := 1.0$	4.1.6.2 (5)
- Shape factor:	$C_a := 1.0$	4.1.6.2 (8)
- 1 in 50-year ground snow load factor:	$S_s := 1.1kPa$	Appendix C, Table C-2
- 1 in 50-year associated rain load:	$S_r := \min\left[0.1kPa, S_s \cdot (C_b \cdot C_w \cdot C_s \cdot C_a)\right]$ $S_r = 0.1 \cdot kPa$	Appendix C, Table C-2
Specified Snow Load:	$S := I_s \cdot \left[S_s \cdot (C_b \cdot C_w \cdot C_s \cdot C_a) + S_r\right]$ $\boxed{S = 1.23 \cdot kPa}$	4.1.6.2

2.0 Calculated Wind Load

- Height of structure:	$h := 30.2m$		
- Importance factor:	$I_W := 1.25$ (Post-Disaster)	Table 4.1.7.1	
- Exposure factor:	$C_e := \max\left[0.9, \left(\frac{h}{10m}\right)^{0.2}\right] = 1.25$	4.1.7.1 (5b)	
- Gust effect factor:	$C_g := 2.0$	4.1.7.1 (6)	
- External Pressure Coefficient:	$C_p := 1.0$	4.1.7.1	(Conservative)
-Reference Velocity Pressure:	$q := 0.48kPa$	Table C-2	1/50 return
Specified Wind Load:	$\boxed{p := I_W \cdot q \cdot (C_e \cdot C_g \cdot C_p) = 1.5 \cdot kPa}$	4.1.7.1	(All directions)

LOAD CALCULATIONS

Project / Client: Alberta Transportation

Subject: Miscellaneous Load Calculations

Objective:

Determine gravity loads due to the pedestrian bridge, upper room, ladders, and landings.

References:

1. Alberta Building Code, 2014.
2. Design Drawings.

PEDESTRIAN BRIDGE

The loads imposed on the gate tower by the pedestrian bridge will be estimated based on information provided by Contech. Since the preliminary reactions received are for a 140'x12' bridge, the reactions will bound the anticipated reactions for the actual bridge which will be approximately 10' wide with the same span.

Width Between Bridge Supports: $b_{bs} := 11\text{ft} + 9\text{in} = 3.58\,\text{m}$

Ratio of Actual Span to Provided Span: $r_s := 1.0 = 1$

Reactions from Drawings (Each Base Plate)

Dead Load: $P_{D.p} := 44.0\text{kip} = 195.72\cdot\text{kN}$

Uniform Live Load: $P_{L.p} := 37.8\text{kip} = 168.14\cdot\text{kN}$

Vehicle Load: $P_{V.p} := 10.0\text{kip} = 44.48\cdot\text{kN}$

$11.205\text{kip} = 49.84\cdot\text{kN}$

Wind Uplift: $P_{U.p} := -14.35\text{kip} = -63.83\cdot\text{kN}$

Wind: $M_{W.p} := 11.205\text{kip}\cdot b_{bs} = 178.51\cdot\text{kN}\cdot\text{m}$

$H_{W.p} := 23.685\text{kip} = 105.36\cdot\text{kN}$

Thermal: $L_{T.p} := 6.6\text{kip}$

Adjusted Reactions for Actual Span

Number of Base Plates on Gate Tower: $n_{bp} := 2$

Dead Load: $P_{D.bridge} := n_{bp} \cdot P_{D.p} = 391.44 \cdot kN$

Uniform Live Load: $P_{L.bridge} := n_{bp} \cdot P_{L.p} = 336.29 \cdot kN$

Vehicle Load: $P_{V.bridge} := n_{bp} \cdot P_{V.p} = 88.96 \cdot kN$

Wind Uplift: $P_{W.bridge} := n_{bp} \cdot P_{U.p} = -127.66 \cdot kN$

Wind: $M_{WY.bridge} := M_{W.p} = 178.51\,m \cdot kN$

$H_{WX.bridge} := H_{W.p} = 105.36 \cdot kN$

Thermal: $L_{T.bridge} := n_{bp} \cdot L_{T.p} = 58.72 \cdot kN$

UPPER ROOM

The weight of the upper room is modeled based on tributary elevations. The weight of the bottom half is applied to the top of the tower and the weight of the top half is applied to a rigid link at the mean roof elevation.

Upper Room Material: Matl := "Concrete"

Unit Weight of Concrete: $\gamma_c := 23.5 \frac{kN}{m^3}$

Unit Weight of Steel: $\gamma_s := 77.0 \frac{kN}{m^3}$

WALLS

Wall thickness: $t_w := 0.2m$

Wall Length (Y-Direction): $L_y := 6.1m$

Wall Length (X-Direction): $L_x := 4.7m$

Average Wall Height: $H_w := 3.059m$

Wall Perimeter: $Pe_w := 2 \cdot L_y + 2 \cdot L_x = 21.6\,m$

Tributary Wall Dead Load: $P_{D.wall} := \gamma_c \cdot t_w \cdot Pe_w \cdot \frac{H_w}{2} = 155.27 \cdot kN$

ROOF

Roof Slope:	$\theta := \operatorname{atan}\left(\frac{1}{50}\right) = 1.15 \cdot deg$
Roof Length (Y-Direction):	$L_{r.y} := \frac{6.3m}{\cos(\theta)} = 6.3013\, m$
Roof Length (X-Direction):	$L_{r.x} := 5.3m$
Roof Area:	$A_{roof} := L_{r.y} \cdot L_{r.x} = 33.4\, m^2$
Roof Thickness:	$t_r := 0.2m$
Roof Snow Load:	$p_{S.R} := 1.23kPa$
Roof Live Load (REF. 1, Table 4.1.5.3):	$p_{L.R} := 1kPa$
Assumed Hoist Weight:	$W_{hoist} := 250lbf = 1.11 \cdot kN$
Hoist Track Assumed Weight:	$w_{track} := 40 \frac{lbf}{ft} = 0.58 \cdot \frac{kN}{m}$
Hoist Track Assumed Length:	$l_{track} := 4m = 13.12 \cdot ft$
Roof Dead Load:	$\boxed{P_{D.roof} := \gamma_c \cdot A_{roof} \cdot t_r + W_{hoist} + w_{track} \cdot l_{track} = 160.41 \cdot kN}$
Roof Live Load:	$\boxed{P_{L.roof} := p_{L.R} \cdot A_{roof} = 33.4 \cdot kN}$
Roof Snow Load:	$\boxed{P_{S.roof} := p_{S.R} \cdot A_{roof} = 41.08 \cdot kN}$

FLOOR

Floor weight is conservatively estimated assuming constant thickness concrete over the entire floor area with no deck.

Floor Area:	$A_{floor} := 9.7m^2$
Assumed Slab Thickness:	$t_{slab} := 0.15m$
Floor Collateral Dead Load:	$p_{D.floor} := 2.4kPa$
Floor Live Load (REF. 1, Table 4.1.5.3, Storage Areas):	$p_{L.floor} := 4.8kPa$
Floor Dead Load:	$P_{D.floor} := A_{floor} \cdot (\gamma_c \cdot t_{slab} + p_{D.floor}) = 57.47 \cdot kN$
Floor Live Load:	$P_{L.floor} := p_{L.floor} \cdot A_{floor} = 46.56 \cdot kN$

WIND

Wind Load Pressure:	$p := 1.5kPa$	
Wind Area for X-Direction:	$A_{w.x} := H_w \cdot L_y = 18.66\ m^2$	
Wind Area for Y-Direction:	$A_{w.y} := H_w \cdot L_x = 14.38\ m^2$	
Wind Area for Roof Uplift:	$A_{w.u} := L_{r.x} \cdot L_{r.y} = 33.4\ m^2$	
Wind Load X-Direction (Windward + Leeward):	$H_{WX.room} := p \cdot A_{w.x} = 27.99 \cdot kN$	Applied to top & bottom
Wind Load Y-Direction (Windward + Leeward):	$H_{WY.room} := p \cdot A_{w.y} = 21.57 \cdot kN$	Applied to top & bottom
Wind Load Uplift:	$P_{W.room} := p \cdot A_{w.u} = 50.1 \cdot kN$	

LANDINGS

Landing Member Size: Mem := "MC310x60"

Landing Member Weight: $w_{member} := 60\frac{kg}{m}\cdot g = 0.59\cdot\frac{kN}{m}$

Landing Length: $L_{landing} := 4m$

Landing Width: $B_{landing} := 2m$

Assumed Grating Weight: $w_{grating} := 0.2\frac{kN}{m}$

Floor Live Load (REF. 1, Table 4.1.5.3, Service Rooms): $p_{L.grating} := 3.6kPa$

Landing Dead Load: $P_{D.landing} := \left(2\cdot w_{member} + w_{grating}\right)\cdot L_{landing} = 5.51\cdot kN$

Landing Live Load: $P_{L.landing} := p_{L.grating}\cdot\left(L_{landing}\cdot B_{landing}\right) = 28.8\cdot kN$

LADDERS

Ladder Bar Thickness: $t_{l.v} := 12mm$

Ladder Bar Width: $b_{l.v} := 75mm$

Ladder Rung Thickness/Width: $t_{rung} := 19mm$

Ladder Rung Length: $l_{rung} := 400mm$

Ladder Rung Spacing: $s_{rung} := 0.3m$

Ladder Dead Load: $P_{D.ladder} := \gamma_s\cdot\left[2\cdot t_{l.v}\cdot b_{l.v} + t_{rung}{}^2\cdot l_{rung}\cdot\left(\frac{1}{s_{rung}}\right)\right] = 0.18\cdot\frac{kN}{m}$

GATES

Assumed Gate Weight: $W_{gate} := 2tonf = 17.79\cdot kN$

Gate Dead Load: $P_{D.gate} := 2\cdot W_{gate} = 35.59\cdot kN$

HYDROSTATIC/SOIL LOAD CALCULATIONS

Project / Client: Springbank Off-Stream Storage/Alberta Transportation

Subject: Load Calculations for Stability Analysis

Objective:

Determine additional loads on the gate tower due to surrounding water and soil for stability analysis.

References:

1. Design Drawings.

Material Properties:

Unit Weight of Soil: $\gamma_{soil} := 20\frac{kN}{m^3}$

Unit Weight of Water: $\gamma_w := 9.8\frac{kN}{m^3}$

Coefficient of Lateral Earth Pressure: $K_o := 0.59$

Tower Geometry:

Offset from Outlet Works CL to Foundation CL: $e_f := 0.25m$

Section Widths (Exposed to Soil)

Section 1, 2: $b_{1.1} := 6.4m$ $b_{1.2} := 10.5m$

Section 3-6: $b_{2.1} := 4.2m$ $b_{2.2} := 6.4m$

Section 7: $b_{3.1} := 3.6m$ $b_{3.2} := 5.8m$

Soil Weight (U1, U2, UN1, UN2, UN4, E1, E2):

1x3 Identity Vector: $I := \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$

Soil Column Areas: $A_s := \begin{pmatrix} 25.72 \\ 39.59 \\ 44.97 \end{pmatrix} \cdot m^2$

Soil Column Heights: $H_s := \begin{pmatrix} 2.40 \\ 12.740 \\ 2 \end{pmatrix} \cdot m$

Soil Column Eccentricites (X-Direction): $e_{x.s} := \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \cdot m$

Soil Column Eccentricites (Y-Direction): $e_{y.s} := \begin{pmatrix} 0.042 \\ -0.3602 \\ -0.2757 \end{pmatrix} \cdot m + e_f = \begin{pmatrix} 0.29 \\ -0.11 \\ -0.03 \end{pmatrix} m$

Uniform Surcharge Height: $H_{sur} := 2 \cdot m$

Soil Column Weights: $w_s := \gamma_{soil} \cdot diag(A_s) \cdot diag(H_s) \cdot I = \begin{pmatrix} 1234.56 \\ 10087.53 \\ 1798.8 \end{pmatrix} \cdot kN$

Soil Column Total Weight: $W_s := w_s \cdot I = 13120.89 \cdot kN$

Soil Column Net Eccentricity (X-Direction): $e_{x.n.soil} := \dfrac{w_s \cdot e_{x.s}}{w_s \cdot I} = 0$

Soil Column Net Eccentricity (Y-Direction): $e_{y.n.soil} := \dfrac{w_s \cdot e_{y.s}}{w_s \cdot I} = -0.061\ m$

Soil Lateral Pressures (UN4-1):

Uniform Distributed Lateral Load Due to Surcharge (Section1, 2): $w_{sur1.1} := H_{sur} \cdot \gamma_{soil} \cdot K_o \cdot b_{1.1} = 151.04 \cdot \dfrac{kN}{m}$

Uniform Distributed Lateral Load Due to Surcharge (Section 3-6): $w_{sur2.1} := H_{sur} \cdot \gamma_{soil} \cdot K_o \cdot b_{2.1} = 99.12 \cdot \dfrac{kN}{m}$

Uniform Distributed Lateral Load Due to Surcharge (Section 7): $w_{sur3.1} := H_{sur} \cdot \gamma_{soil} \cdot K_o \cdot b_{3.1} = 84.96 \cdot \dfrac{kN}{m}$

Soil Lateral Pressures (UN4-2):

Uniform Distributed Lateral Load Due to Surcharge (Section1, 2): $w_{sur1.2} := H_{sur} \cdot \gamma_{soil} \cdot K_o \cdot b_{1.2} = 247.8 \cdot \dfrac{kN}{m}$

Uniform Distributed Lateral Load Due to Surcharge (Section 3-6): $w_{sur2.2} := H_{sur} \cdot \gamma_{soil} \cdot K_o \cdot b_{2.2} = 151.04 \cdot \dfrac{kN}{m}$

Uniform Distributed Lateral Load Due to Surcharge (Section 7): $w_{sur3.2} := H_{sur} \cdot \gamma_{soil} \cdot K_o \cdot b_{3.2} = 136.88 \cdot \dfrac{kN}{m}$

Water Weight (UN1):

1x4 Identity Vector: $I := \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$

Water Column Areas: $A_{UN1} := \begin{pmatrix} 14.02 \\ 4.8 \\ 9.6 \end{pmatrix} \cdot m^2$

Water Column Heights: $H_{UN1} := \begin{pmatrix} 1.6 \\ 2.04 \\ 1.43 \end{pmatrix} \cdot m$

Water Column Eccentricites (X-Direction): $e_{x.UN1} := \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \cdot m$

Water Column Eccentricites (Y-Direction): $e_{y.UN1} := \begin{pmatrix} 0.127 \\ 0 \\ 0 \end{pmatrix} \cdot m + e_f = \begin{pmatrix} 0.38 \\ 0.25 \\ 0.25 \end{pmatrix} m$

Water Column Weights: $w_{UN1} := \gamma_w \cdot \mathrm{diag}(A_{UN1}) \cdot \mathrm{diag}(H_{UN1}) \cdot I = \begin{pmatrix} 219.83 \\ 95.96 \\ 134.53 \end{pmatrix} \cdot kN$

Water Column Total Weight: $\boxed{W_{UN1} := w_{UN1} \cdot I = 450.33 \cdot kN}$

Water Column Net Eccentricity (X-Direction): $\boxed{e_{x.n.UN1} := \dfrac{w_{UN1} \cdot e_{x.UN1}}{w_{UN1} \cdot I} = 0}$

Water Column Net Eccentricity (Y-Direction): $\boxed{e_{y.n.UN1} := \dfrac{w_{UN1} \cdot e_{y.UN1}}{w_{UN1} \cdot I} = 0.312\ m}$

Water Weight (UN2):

Water Column Areas:

$$A_{UN2} := \begin{pmatrix} 8.26 \\ 2.4 \\ 4.8 \end{pmatrix} \cdot m^2$$

Water Column Heights:

$$H_{UN2} := H_{UN1} = \begin{pmatrix} 1.6 \\ 2.04 \\ 1.43 \end{pmatrix} m$$

Water Column Eccentricites (X-Direction):

$$e_{x.UN2} := \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \cdot m$$

Water Column Eccentricites (Y-Direction):

$$e_{y.UN2} := \begin{pmatrix} 2.38 \\ 1.30 \\ 1.30 \end{pmatrix} \cdot m + e_f = \begin{pmatrix} 2.63 \\ 1.55 \\ 1.55 \end{pmatrix} m$$

Water Column Weights:

$$w_{UN2} := \gamma_w \cdot \text{diag}(A_{UN2}) \cdot \text{diag}(H_{UN2}) \cdot I = \begin{pmatrix} 129.52 \\ 47.98 \\ 67.27 \end{pmatrix} \cdot kN$$

Water Column Total Weight:

$$\boxed{W_{UN2} := w_{UN2} \cdot I = 244.76 \cdot kN}$$

Water Column Net Eccentricity (X-Direction):

$$\boxed{e_{x.n.UN2} := \frac{w_{UN2} \cdot e_{x.UN2}}{w_{UN2} \cdot I} = 0}$$

Water Column Net Eccentricity (Y-Direction):

$$\boxed{e_{y.n.UN2} := \frac{w_{UN2} \cdot e_{y.UN2}}{w_{UN2} \cdot I} = 2.121\ m}$$

Water Weight (E1):

1x4 Identity Vector: $I := \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$

$40kPa = 835.42 \cdot psf$

Water Column Areas: $A_{E1} := \begin{pmatrix} 14.02 \\ 4.8 \\ 9.6 \end{pmatrix} \cdot m^2$

Water Column Eccentricites (X-Direction): $e_{x.E1} := \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \cdot m$

Water Column Eccentricites (Y-Direction): $e_{y.E1} := \begin{pmatrix} 0.127 \\ 0 \\ 0 \end{pmatrix} \cdot m + e_f = \begin{pmatrix} 0.38 \\ 0.25 \\ 0.25 \end{pmatrix} m$

Water Column Weights: $w_{E1} := \gamma_w \cdot diag(A_{E1}) \cdot diag(H_{E1}) \cdot I = \begin{pmatrix} 219.83 \\ 95.96 \\ 2210.88 \end{pmatrix} \cdot kN$

Water Column Total Weight: $\boxed{W_{E1} := w_{E1} \cdot I = 2526.68 \cdot kN}$

Water Column Net Eccentricity (X-Direction): $\boxed{e_{x.n.E1} := \frac{w_{E1} \cdot e_{x.E1}}{w_{E1} \cdot I} = 0}$

Water Column Net Eccentricity (Y-Direction): $\boxed{e_{y.n.E1} := \frac{w_{E1} \cdot e_{y.E1}}{w_{E1} \cdot I} = 0.261\ m}$

Water Weight (E2):

Water Column Areas: $A_{E2} := \begin{pmatrix} 8.26 \\ 2.4 \\ 4.8 \end{pmatrix} \cdot m^2$

Water Column Heights: $H_{E2} := H_{E1} = \begin{pmatrix} 1.6 \\ 2.04 \\ 23.5 \end{pmatrix} m$

Water Column Eccentricites (X-Direction): $e_{x.E2} := \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \cdot m$

Water Column Eccentricites (Y-Direction): $e_{y.E2} := \begin{pmatrix} 2.38 \\ 1.30 \\ 1.30 \end{pmatrix} \cdot m + \blacksquare$

Water Column Weights: $w_{E2} := \gamma_w \cdot diag(A_{E2}) \cdot diag(H_{E2}) \cdot I = \begin{pmatrix} 129.52 \\ 47.98 \\ 1105.44 \end{pmatrix} \cdot kN$

Water Column Total Weight: $\boxed{W_{E2} := w_{E2} \cdot I = 1282.94 \cdot kN}$

Water Column Net Eccentricity (X-Direction): $\boxed{e_{x.n.E2} := \frac{w_{E2} \cdot e_{x.E2}}{w_{E2} \cdot I} = 0}$

Water Column Net Eccentricity (Y-Direction): $\boxed{e_{y.n.E2} := \frac{w_{E2} \cdot e_{y.E2}}{w_{E2} \cdot I} = \blacksquare}$

Uplift Parameters:

Footing Width: $B_f := 6.4m$

Footing Length: $L_f := 10.5m$

Footing Area: $A_f := B_f \cdot L_f = 67.2\,m^2$

Uplift (U1, U2):

Elevation Head: $h_U := 1.8m$

Uplift Pressure: $p_U := \gamma_w \cdot h_U = 17.64 \cdot kPa$

Uplift Force: $\boxed{U_U := p_U \cdot A_f = 1185.41 \cdot kN}$

Uplift (UN1, UN2):

Elevation Head: $h_{UN} := 6.87m$

Uplift Pressure: $p_{UN} := \gamma_w \cdot h_{UN} = 67.33 \cdot kPa$

Uplift Force: $\boxed{U_{UN} := p_{UN} \cdot A_f = 4524.31 \cdot kN}$

Uplift (E1, E2):

Elevation Head: $h_E := 28.94m$

Uplift Pressure: $p_E := \gamma_w \cdot h_E = 283.61 \cdot kPa$

Uplift Force: $\boxed{U_E := p_E \cdot A_f = 19058.73 \cdot kN}$

Hydrostatic Gate Loads (UN1, UN2):

Flow Chamber Width: $b_{flow} := 1.2m$

Flow Chamber Height: $h_{flow} := 1.6m$

Water Level Elevation: $EL_{UN} := 1191.43m$

Top of Flow Chamber Elevation: $EL_T := 1187.96m$

Bottom of Flow Chamber Elevation: $EL_B := 1186.36m$

Pressure at Top of Chamber: $p_{T.UN} := \gamma_w \cdot (EL_{UN} - EL_T) = 34.01 \cdot kPa$

Pressure at Bottom of Chamber: $p_{B.UN} := \gamma_w \cdot (EL_{UN} - EL_B) = 49.69 \cdot kPa$

Total Load on Gate: $F_{UN} := \frac{1}{2} \cdot (p_{T.UN} + p_{B.UN}) \cdot h_{flow} \cdot b_{flow} = 80.34 \cdot kN$

Load Applied to Each Joint (2 Total): $\boxed{P_{UN} := \frac{F_{UN}}{2} = 40.17 \cdot kN}$

Hydrostatic Gate Loads (E1, E2):

Water Level Elevation: $EL_E := 1213.5m$

Pressure at Top of Chamber: $p_{T.E} := \gamma_w \cdot (EL_E - EL_T) = 250.29 \cdot kPa$

Pressure at Bottom of Chamber: $p_{B.E} := \gamma_w \cdot (EL_E - EL_B) = 265.97 \cdot kPa$

Total Load on Gate: $F_E := \frac{1}{2} \cdot (p_{T.E} + p_{B.E}) \cdot h_{flow} \cdot b_{flow} = 495.61 \cdot kN$

Load Applied to Each Joint (2 Total): $\boxed{P_E := \frac{F_E}{2} = 247.81 \cdot kN}$

Project: Springbank Off-Stream Storage — By: ACG - 10/09/2019
Title: Foundation Stiffness Calculations Per FEMA 356 — Checked: CG - 10/09/2019
Structure: Low Level Outlet Gate Tower

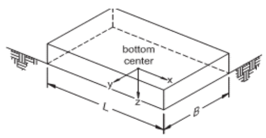
FEMA equations are to be used with U.S. Customary Units, therefore, the inputs are converted from SI for use with the equations and the final values are converted back.

B (m)	L (m)	D (m)	d (m)	h (m)	L/B	D/B	G (MPa)	v
6.40	10.00	18.94	1.8	18.04	1.56	2.96	10	0.45

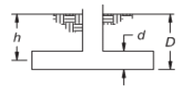
B (ft)	L (ft)	D (ft)	d (ft)	h (ft)	L/B	D/B	G (psf)	v
21.0	32.8	62.1	5.9	59.19	1.56	2.96	208,854	0.45

Chapter 4: Foundations and Geologic Site Hazards

Degree of Freedom	Stiffness of Foundation at Surface	Note
Translation along x-axis	$K_{x,sur} = \frac{GB}{2-v}\left[3.4\left(\frac{L}{B}\right)^{0.65} + 1.2\right]$	
Translation along y-axis	$K_{y,sur} = \frac{GB}{2-v}\left[3.4\left(\frac{L}{B}\right)^{0.65} + 0.4\frac{L}{B} + 0.8\right]$	
Translation along z-axis	$K_{z,sur} = \frac{GB}{1-v}\left[1.55\left(\frac{L}{B}\right)^{0.75} + 0.8\right]$	
Rocking about x-axis	$K_{xx,sur} = \frac{GB^3}{1-v}\left[0.4\left(\frac{L}{B}\right) + 0.1\right]$	
Rocking about y-axis	$K_{yy,sur} = \frac{GB^3}{1-v}\left[0.47\left(\frac{L}{B}\right)^{2.4} + 0.034\right]$	Orient axes such that $L \geq B$
Torsion about z-axis	$K_{zz,sur} = GB^3\left[0.53\left(\frac{L}{B}\right)^{2.45} + 0.51\right]$	



Degree of Freedom	Correction Factor for Embedment	Note
Translation along x-axis	$\beta_x = \left(1 + 0.21\sqrt{\frac{D}{B}}\right) \cdot \left[1 + 1.6\left(\frac{hd(B+L)}{BL^2}\right)^{0.4}\right]$	
Translation along y-axis	$\beta_y = \beta_x$	
Translation along z-axis	$\beta_z = \left[1 + \frac{1}{21}\frac{D}{B}\left(2 + 2.6\frac{B}{L}\right)\right] \cdot \left[1 + 0.32\left(\frac{d(B+L)}{BL}\right)^{2/3}\right]$	d = height of effective sidewall contact (may be less than total foundation height)
Rocking about x-axis	$\beta_{xx} = 1 + 2.5\frac{d}{B}\left[1 + \frac{2d}{B}\left(\frac{d}{D}\right)^{-0.2}\sqrt{\frac{B}{L}}\right]$	h = depth to centroid of effective sidewall contact
Rocking about y-axis	$\beta_{yy} = 1 + 1.4\left(\frac{d}{L}\right)^{0.6}\left[1.5 + 3.7\left(\frac{d}{L}\right)^{1.9}\left(\frac{d}{D}\right)^{-0.6}\right]$	For each degree of freedom, calculate $K_{emb} = \beta K_{sur}$
Torsion about z-axis	$\beta_{zz} = 1 + 2.6\left(1 + \frac{B}{L}\right)\left(\frac{d}{B}\right)^{0.9}$	



FEMA 356, Figure 4-4

Note: When L = B, use x-axis rocking stiffness and embedment correction factor for Y-axis rocking

* Axis Orientation is based on FEMA 356. See below for SAP2000 equivalent.

$X_{fema} = Y_{SAP}$; $Y_{fema} = X_{SAP}$; $Z_{fema} = Z_{SAP}$

Contents

List of Figures

List of Tables

1. Model geometry

This section provides model geometry information, including items such as joint coordinates, joint restraints, and element connectivity.

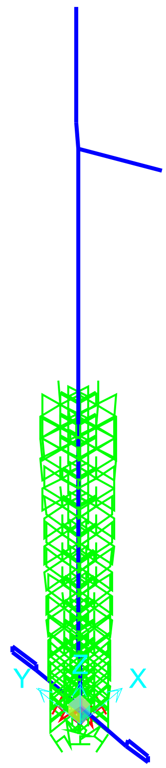

Figure 1: Finite element model

1.1. Joint coordinates

Table 1: Joint Coordinates

Table 1: Joint Coordinates

Joint	CoordSys	CoordType	GlobalX	GlobalY	GlobalZ
			mm	mm	mm
1	GLOBAL	Cartesian	0.	0.	0.

7. Design preferences

This section provides the design preferences for each type of design, which typically include material reduction factors, framing type, stress ratio limit, deflection limits, and other code specific items.

7.1. Steel design

Gate Structure - Stability Analysis

GATE TOWER STATIC STABILITY ANALYSIS SUMMARY

Job Name:	Springbank Off-Stream Storage Project	Number:	110773396
Site:	Gate Tower	Originator:	ACG 7/2/2020

Results Summary:

SR-1 - Summary of Intake Structure Static Stability Assessment

Load Case	Load Category	Sliding Stability Safety Factor		Base Area in Compression(1)		Bearing Pressures (3) (kPa)				Flotation Safety Factor	
						Long Term		Short Term			
		Required	Calculated	Required	Calculated	Required	Calculated	Required	Calculated	Required	Calculated
1- Empty Reservoir	Usual	1.5	>10	100%	100%	427.0	411.9	569.3	423.8	1.5	>10
2- 10-Year Flood, Gates Open	Unusual	1.3	>10	100%	100%	427.0	367.8	569.3	383.8	1.3	6.10
3- 10-Year Flood, Front Gate Closed	Unusual	1.3	>10	100%	100%	427.0	353.0	569.3	368.6	1.3	5.95
4- Staged Construction	Unusual	1.3	>10	100%	100%	250.0	203.3	NA		1.3	>10
5- Crane Adjacent to Tower	Unusual	1.3	>10	100%	100%	NA		569.3	428.0	1.3	>10
6- Max Pool, Gates Open	Extreme	1.1	>10	75%	100%	427.0	349.9	569.3	359.1	1.1	2.16
7- Max Pool, Front Gate Closed	Extreme	1.1	>10	75%	100%	427.0	337.4	569.3	345.4	1.1	2.03

(1)- 100% base compression = resultant within the middle 1/3
75% base compression = resultant within the middle 1/2
>0% base compression = resultant within the base
(2)- Additional future fill doesn't control by inspection. Since bearing capacity is governed by differential settlement between tower and conduit, additional fill will only increase bearing capacity.
(3)- Bearing pressure limits are based on the values shown in the table below.

Allowable Bearing Capacity (kPa)		Ultimate Bearing Capacity (kPa)	
Construction	250	Construction	750
Final Embankment Configuration*	427	Final Embankment Configuration*	1281

*Based on the allowable bearing pressure due to differential settlement between conduit and the gate tower, multiplied by a safety factor of 3.

GATE TOWER STATIC STABILITY ANALYSIS SUMMARY			
Job Name:	Springbank Off-Stream Storage Project	Number:	110773396
Site:	Gate Tower	Originator:	ACG 7/2/2020

Detailed Load Cases:

LC #	Designation	Condition Classification	Description	Dead	Live	Soil	Water				Snow	Wind				EQ (24 Cases)	Soil Springs	
							10-Year Flood		Max Pool			Tower Wind		Upper Building/Bridge				
							Gates Open*	Front Gate Closed	Back Gate Closed*	Front Gate Closed		Wind-X	Wind-Y	Wind-X	Wind-Y		Saturated	Dry
1	U1-1	Usual	Empy Reservoir, Winter															
	U1-2

	E2-4+														+			
	E2-4-														-			
8**	E3	Extreme	Extreme Earthquake															
9	PE-1	Usual	Post-Earthquake															
	PE-2+												+		+			
	PE-2-												-		-			

*Gates open bounds back gate closed.
**Seismic includes 24 combinations of EQx, EQy, EQz
***Includes lateral earth pressure due to 1m of surcharge in the same direction of the wind to account for construction loads.
****Tower is not operational, therefore, water surrounds the tower but is not within it.

GATE TOWER SEISMIC STABILITY ANALYSIS SUMMARY

Job Name:	Springbank Off-Stream Storage Project	Number:	110773396
Site:	Gate Tower	Originator:	ACG 7/2/2020

Results Summary:

SR-1 - Summary of Intake Structure Static Stability Assessment									
Load Case	**Load Category**	**Sliding Stability Safety Factor**		**Base Area in Compression(1)**		**Bearing Pressures (2) (kPa)**		**Flotation Safety Factor**	
		Required	**Calculated**	**Required**	**Calculated**	**Required**	**Calculated**	**Required**	**Calculated**
7- Extreme Earthquake(3)	Extreme	N/A	>10	N/A	100%	N/A	718.2	N/A	>10
8- Post Earthquake	PE	1.1	>10	75%	100%	569.3	397.8	1.1	>10

(1)- 100% base compression = resultant within the middle 1/3
75% base compression = resultant within the middle 1/2
>0% base compression = resultant within the base
(2)- Bearing pressure limits are based on the values shown in the table below.
(3)- There are no criteria for seismic - results are provided for information only and to support the Post-Earthquake load case.

Allowable Bearing Capacity (kPa)		**Ultimate Bearing Capacity (kPa)**	
Staged Construction	250	Staged Construction	750
Final Embankment Configuration*	427	Final Embankment Configuration*	1281

*Based on the allowable bearing pressure due to differential settlement between conduit and the gate tower, multiplied by the safety factor of 3.

Required Stability Safety Factors

Classification	Resultant DBM Table 7	Bearing (kPa) AT WCS 8.4	Uplift DBM Table 7	Sliding DBM Table 7
Usual	MIDDLE THIRD	< 150 (Allowable)	1.5	1.5
Unusual	MIDDLE THIRD	< 150 (Allowable)	1.3	1.3
Extreme	MIDDLE HALF	< 150 (Allowable)	1.1	1.1

Stabilty Results

Condition	Classification	Resultant	Bearing (kPa)	Uplift	Sliding
1 Dry Condition	Usual	MIDDLE THIRD	93.8	N/A	2.5
2 10 Year Flow	Unusual	MIDDLE THIRD	75.0	4.3	1.5
3 Rapid Gate Closure	Unusual	MIDDLE THIRD	65.2	2.8	1.5
4 Const./ Maint.	Unusual	MIDDLE THIRD	88.2	N/A	1.9
5 Maximum Flow	Extreme	MIDDLE THIRD	71.4	3.3	1.4
6 Earthquake*	Extreme	MIDDLE THIRD	90.9	>10	1.0-1.9
7 Post-Earthquake**	Extreme	MIDDLE THIRD	Passes	Passes	Passes

* Per DBM Section 7.2, there is no stability acceptance criteria for the seismic load cases.
** Because the Resultant from the Earthquake load cases remains in the middle third of the structure, the Post-Earthquake condition of the structure will have the same results as the Pre-Earthquake condition.

Load Condition Descriptions:
(See load notation page 2)

1 Dry Condition
Ws + Wsoil + Fo (DEAD + EARTH)
Dry Fill
Empty Basin

2 10 Year Flow
Ws + Wsoil + Ww + Fo+ Fd + U (DEAD + EARTH + HYDRO + UPLIFT)
Saturated fill from 10 year flow head water to 10 year flow tailwater
Water in Basin @ 10 year flow surface height

3 Rapid Gate Closure
Ws + Wsoil + Fo + U (DEAD + EARTH + UPLIFT)
Saturated fill from maximum flow head water to maximum flow tailwater
Empty Basin

4 Construction/ Maintenance
Ws + Wsoil + Fo + Fs (DEAD + EARTH + SURCHARGE)
Dry Fill
Empty Basin
Construction Live Load or Surcharge

5 Max Flow
Ws + Wsoil + Ww + Fo + Fd + U (DEAD + EARTH + HYDRO + UPLIFT)
Saturated fill from maximum flow head water to maximum flow tailwater
Water in Basin @ max flow surface height

6 Earthquake
Ws + Wsoil + Fo + Qh + Qv (DEAD + EARTH + EQ)
Dry Fill
No Water in Basin
Earthquake Soil Loads:
6a : 1.0*kh +/- 0.0*kv
6b : 1.0*kh +/- 0.3*kv
6c : 0.3*kh +/- 1.0*kv

7 Post-Earthquake
Ws + Wsoil + Fo (DEAD + EARTH)
Dry Fill
Empty Basin
Bearing Area based on resultant location from Earthquake load case.

CDA *Dam Safety Guidelines*, 2007.
Springbank Off-Stream Storage Project - Design Basis Memorandum (DBM), 2019.

- Water elevation in basin is assumed to be linear from headwater elevation to tailwater elevation.
- Groundwater elevation is assumed to vary from the headwater elevation to the tailwater elevation.
- Soil elevation is assumed to be at top of wall at outlet and at top of slab elevation at end of basin.
- Slab slope is assumed to be level, except for uplift and lateral earth pressure.
- Forces perpendicular to the flow are assumed to not control for stability due to limited soil area, limited exposed wall surfaces, and passive soil pressure.
- By engineering judgment, the uplift difference due to the shallow slab slope (0.018) is negligible; thus will not affect the results as calculated herein.

INPUTS

General:

Wall Thickness: $t_w := 500\text{mm}$

Slab Overhang: $t_o := 500\text{mm}$

Slab Thickness: $t_s := 750\text{mm}$

Slope of Slab: $S_s := 0.018$

Surcharge Soil Height: $H_s := 1\text{m}$

Number of Baffle Blocks: $n_{bb} := 21$

Baffle Block Height: $H_{bb} := 350\text{mm}$

Baffle Block Width: $W_{bb} := 1440\text{mm}$

Drag Coefficient: $C_d := 2.00$

Water Velocity: $V := 8.02\,\frac{\text{m}}{\text{s}}$ (Rigid Stilling Basin Hydraulic Design)

Moist Soil Unit Weight: $\gamma_m := 20.0\,\frac{\text{kN}}{\text{m}^3}$ (Geotech. Memo 19-07-19 Properties for Embankment Shell)

Saturated Soil Unit Weight: $\gamma_s := 20.0\,\frac{\text{kN}}{\text{m}^3}$

At-Rest Soil Coefficient: $K_o := 0.59$

Passive Soil Coefficient: $K_p := 2.37$

Foundation Soil Friction Angle: $\phi_f := 24°$

Water Unit Weight: $\gamma_w := 9.81 \dfrac{kN}{m^3}$ (DBM Table 2)

Concrete Unit Weight: $\gamma_c := 23.5 \dfrac{kN}{m^3}$ (DBM Table 2)

Submerged Soil Unit Weight: $\gamma_{sub} := \gamma_s - \gamma_w = 10.19 \cdot \dfrac{kN}{m^3}$

Horizontal Seismic Coefficient: $K_h := \dfrac{2}{3} \cdot 0.28 = 0.19$ (Seismic Hazard Assessment - Springbank Off-Stream Dam and Reservoir Table 4)

For 3 Seismic Cases: $K_{h.a} := 1.0 \cdot K_h = 0.19$ $K_{h.b} := 1.0 \cdot K_h = 0.19$ $K_{h.c} := 0.3 \cdot K_h = 0.06$

Vertical Seismic Coefficient: $K_v := 0.56 \cdot K_h = 0.10$ (Seismic Hazard Assessment - Springbank Off-Stream Dam and Reservoir Table 5)

For 3 Seismic Cases: $K_{v.a} := 0.0 \cdot K_v = 0.00$ $K_{v.b} := 0.3 \cdot K_v = 0.03$ $K_{v.c} := 1.0 K_v = 0.10$

Allowable Bearing Pressure (Long Term): $q_{a.lt} := 150kPa$ (Geotech. Memo 19-07-19)

Allowable Bearing Pressure (Short Term): $q_{a.st} := 200kPa$ (Geotech. Memo 19-07-19)

Elevations:

At Outlet:

Top of Slab Elevation: $E_{slab} := 1183.120m$

Top of Wall Elevation: $E_{wall.1} := 1188.5m$

Top of Soil Elevation: $E_{s.1} := 1188.5m$

Headwater Elevation (10 Yr): $E_{w.1.un} := E_{slab} + 0.73m = 1183.85 \cdot m$

Headwater Elevation (max): $E_{w.1.e} := E_{slab} + 1.43m = 1184.55 \cdot m$

(From Hydraulic Design, assume low resistance in conduit for stability calculations)

At End of Basin:

Top of Wall Elevation: $E_{wall.2} := 1185.280m$

Top of Soil Elevation: $E_{s.2} := E_{slab} = 1183.12 \cdot m$

Tailwater Elevation (10 Yr): $E_{w.2.un} := E_{slab} + 0.63m = 1183.75 \cdot m$ (From Hydraulic Design)

Tailwater Elevation (max): $E_{w.2.e} := E_{slab} + 1.1m = 1184.22 \cdot m$

Structure Dimensions:

Internal Basin Width: $W_b := 10m$

Basin Slab Width: $W_{bs} := W_b + 2(t_o + t_w) = 12.00 \cdot m$

Conduit Width: $W_c := 2.4m$

Rectangular Basin Length: $L_b := 9m$

Basin Transition Extension Length: $L_e := 1.2m$

Basin and Extension Length: $L_{be} := L_b + L_e = 10.20 \cdot m$

Basin Transition Length: $L_t := 5.6m$

Chute Transition Length: $L_c := 1.2m$

Transition and Chute Length: $L_{tc} := L_t + L_c = 6.80 \cdot m$

End of Basin:

Cutoff Wall Height: $h_c := 1000mm$

Cutoff Wall Thickness: $t_c := 500mm$

Basin Wall Height: $h_e := E_{wall.2} - E_{slab} = 2.16 \cdot m$

End of Transition:

Transition Wall Height: $h_t := E_{wall.1} - E_{slab} = 5.38 \cdot m$

Transition Ledge Thickness: $t_{tl} := 500mm$

Transition Ledge Length: $L_{tl} := 1000mm$

Top of Soil Elevation: $E_{s.t} := E_{s.1} - \frac{E_{s.1} - E_{s.2}}{L_{tc} + L_{be}} \cdot L_{tc} = 1186.35 \cdot m$

Top of Water Elevation (10 Yr): $E_{w.t.un} := \frac{E_{w.2.un} - E_{w.1.un}}{L_{tc} + L_{be}} \cdot L_{tc} + E_{w.1.un} = 1183.81 \cdot m$

Top of Water Elevation (Max): $E_{w.t.e} := \frac{E_{w.2.e} - E_{w.1.e}}{L_{tc} + L_{be}} \cdot L_{tc} + E_{w.1.e} = 1184.42 \cdot m$

Wall Angle: $\theta := \operatorname{atan}\left[\frac{0.5 \cdot (W_b - W_c)}{L_{tc}}\right] = 29.20 \cdot °$

Diagonal Wall Length: $L_d := \frac{L_t}{\cos(\theta)} = 6.42 \cdot m$

At Outlet:

Conduit Wall Thickness: $t_{wc} := 700mm$

Outlet Wall Thickness: $t_{wo} := 1200mm$

Conduit Slab Thickness: $t_{sc} := 900mm$

Outlet Ledge Thickness: $t_{ol} := 1200mm$

Outlet Ledge Length, Top: $L_{ol.t} := 750mm$

Outlet Ledge Length, Base: $L_{ol.b} := 950mm$

Outlet Ledge Transition Length: $L_{olt} := 1350mm$ Assumed. Based on 1:1 slope.

Conduit Opening Height: $h_{oc} := 2.4m$

Header Wall Width: $W_{hw} := W_c + 2\left(\dfrac{t_w}{\cos(\theta)} + L_c \cdot \tan(\theta)\right) = 4.89 \cdot m$ $L_c = 1.20 \cdot m$

Header Wall Thickness: $t_h := 400mm$ $\theta = 29.20 \cdot deg$

Header Wall Height: $h_h := E_{wall.1} - \left(E_{slab} + h_{oc} + t_{wc}\right) = 2.28 \cdot m$

Chute Transition Slab Width: $W_{sc} := W_c + 2\left(\dfrac{t_o + t_w}{\cos(\theta)} + L_c \cdot \tan(\theta)\right) = 6.03 \cdot m$

RESULTANTS

Note: Resultant locations are referenced from the bottom of the slab at the end of the basin

Structure Weight:

Volume of Outlet Ledge: $V_{ol} := W_{sc} \cdot \left(L_{ol.b} \cdot t_{ol} + \frac{1}{2} L_{olt}^{2}\right) = 12.37 \cdot m^3$

Resultant Location of Outlet Ledge: $$R_{ol} := \frac{L_{ol.b} \cdot t_{ol} \left(\frac{L_{ol.b}}{2} + L_{olt}\right) + \frac{1}{2}\left(L_{olt}^{2}\right)\left(\frac{2}{3} L_{olt}\right)}{\left[\left(L_{ol.b} \cdot t_{ol}\right) + \frac{1}{2}\left(L_{olt}^{2}\right)\right]} + \left[L_{be} + L_{tc} + L_{ol.t} - \left(L_{ol.b} + L_{olt}\right)\right] = 16.86 \cdot m$$

Volume of Chute Slab: $V_{cs} := W_{sc} \cdot L_c \cdot t_s = 5.43 \cdot m^3$

Volume of Chute Walls: $V_{cw} := \left[W_{hw} \cdot \left(h_{oc} + t_{wc}\right) - \left[W_c \cdot 0.5 \cdot h_{oc} + 0.5 \cdot \pi \cdot \left(0.5 \cdot W_c\right)^2\right]\right] \cdot L_c = 12.01 \cdot m^3$

Chute Resultant Loc.: $R_{cs} := L_{be} + L_t + 0.5 \cdot L_c = 16.40 \cdot m$

Volume of Header Wall: $V_{hw} := h_h \cdot t_h \cdot W_{hw} = 4.46 \cdot m^3$

H.W. Resultant Loc.: $R_{hw} := L_{be} + L_t + 0.5 \cdot t_h = 16.00 \cdot m$

Volume of Transition Slab: $V_{ts} := 0.5 \cdot \left(W_{sc} + W_{bs}\right) \cdot L_t \cdot t_s = 37.87 \cdot m^3$

Trans. Slab Resultant Loc.: $R_{ts} := L_{be} + \frac{W_{bs} + 2 \cdot W_{sc}}{3\left(W_{sc} + W_{bs}\right)} L_t = 12.69 \cdot m$

Volume of Transition Walls: $V_{tw} := 2 \cdot h_t \cdot L_d \cdot t_w = 34.51 \cdot m^3$

Trans. Walls Resultant Loc.: $R_{tw} := L_{be} + 0.5 \cdot L_t = 13.00 \cdot m$

Volume of Transition Ledge: $V_{tl} := W_{bs} \cdot \left(L_{tl} \cdot t_{tl} + \frac{1}{2} t_{tl}^{2}\right) = 7.50 \cdot m^3$

Resultant Location of Transition Ledge: $$R_{tl} := \frac{L_{tl} \cdot t_{tl} \left(\frac{L_{tl}}{2} + t_{tl}\right) + \frac{1}{2}\left(t_{tl}^{2}\right)\left(\frac{2}{3} t_{tl}\right)}{L_{tl} \cdot t_{tl} + \frac{1}{2} t_{tl}^{2}} + \left[L_b + 700mm - \left(L_{tl} + t_{tl}\right)\right] = 9.07 \cdot m$$

Volume of Basin Slab: $V_{bs} := W_{bs} \cdot L_{be} \cdot t_s = 91.80 \cdot m^3$

Basin Slab Resultant Loc.: $R_{bs} := 0.5 \cdot L_{be} = 5.10 \cdot m$

Volume of Basin Walls: $V_{bw} := 2 \cdot \left[0.5 \cdot \left(h_t + h_e\right)\right] \cdot L_{be} \cdot t_w = 38.45 \cdot m^3$

Basin Walls Resultant Loc.: $R_{bw} := L_{be} - \frac{h_t + 2h_e}{3\left(h_e + h_t\right)} \cdot L_{be} = 5.83 \cdot m$

Baffle Blocks Volume: $V_{bb} := n_{bb} \cdot H_{bb}{}^2 \cdot W_{bb} = 3.70 \cdot m^3$

Baffle Blocks Resultant Loc.: $R_{bb} := \frac{(3 \cdot 12.025m + 4 \cdot 10.025m + 3 \cdot 8.025m + 4 \cdot 6.025m + 3 \cdot 4.025m + 4 \cdot 2.025m)}{n_{bb}} = 6.88 \cdot n$

Volume of Cutoff Wall: $V_c := h_c \cdot t_c \cdot W_{bs} = 6.00 \cdot m^3$

Cutoff Wall Resultant Loc.: $R_c := 0.5 \cdot t_c = 0.25 \cdot m$

Volume of Side Key: $V_k := 2h_c \cdot t_c \cdot \left(L_{be} + L_d\right) = 16.62 \cdot m^3$

Side Key Resultant Loc.: $R_k := \frac{\left(0.5L_t + L_{be}\right)L_d + \left(0.5L_{be}\right)L_{be}}{L_d + L_{be}} = 8.15 \cdot m$

Volume of Concrete: $V_{conc} := V_{cs} + V_{cw} + V_{hw} + V_{ts} + V_{tw} + V_{tl} \cdots + V_{bs} + V_{bw} + V_{bb} + V_c + V_{ol} + V_k$ $\boxed{V_{conc} = 270.72 \cdot m^3}$

Structure Weight Result. Loc.: $R_s := \frac{V_{ol} \cdot R_{ol} + \left(V_{cs} + V_{cw}\right) \cdot R_{cs} + V_{hw} \cdot R_{hw} + V_{ts} \cdot R_{ts} + V_{tw} \cdot R_{tw} \cdots + V_{tl} \cdot R_{tl} + V_{bs} \cdot R_{bs} + V_{bw} \cdot R_{bw} + V_{bb} \cdot R_{bb} + V_c \cdot R_c + V_k \cdot R_k}{V_{conc}}$ $\boxed{R_s = 8.93 \cdot m}$

Weight of Structure: $W_s := \gamma_c \cdot V_{conc}$ $\boxed{W_s = 6361.97 \cdot kN}$

Slab Centroid:

Length of Slab: $L_s := L_b + L_e + L_t + L_c + L_{ol.t} = 17.75 \cdot m$

Basin Slab and Extention Area: $A_{bs} := W_{bs} \cdot L_{be} = 122.40 \cdot m^2$

Transition Slab Area: $A_{ts} := \frac{1}{2}\left(W_{bs} + W_{sc}\right) \cdot L_t = 50.49 \cdot m^2$

Outlet Slab/Ledge Area: $A_{cs} := W_{sc} \cdot \left(L_c + L_{ol.t}\right) = 11.76 \cdot m^2$

Area of Slab: $A_s := A_{bs} + A_{ts} + A_{cs} = 184.65 \cdot m^2$

Slab Centroid Location: $C_s := \frac{A_{bs} \cdot \frac{L_{be}}{2} + A_{ts} \cdot \left[L_{be} + \frac{W_{bs} + 2W_{sc}}{3\left(W_{sc} + W_{bs}\right)} \cdot L_t\right] + A_{cs} \cdot \left(L_{be} + L_t + \frac{L_c + L_{ol.t}}{2}\right)}{A_s}$

$\boxed{C_s = 7.92 \cdot m}$

Vertical Soil Weight:

Note: Weight of Soil is the same for all load combinations because the moist and saturated soil unit weights as provided are equal

Volume of Soil on Chute Transition: $V_{o.s1} := h_h \cdot (L_c - t_h) \cdot W_{hw} = 8.91 \cdot m^3$

Volume of Soil on Conduit Ledge: $V_{o.s2} := \left[E_{s.1} - (E_{slab} - t_{sc})\right] \cdot (W_{sc} - W_c - 2 \cdot t_{wc}) \cdot L_{ol.t} = 10.51 \cdot m^3$

Volume of Soil on Slab Overhang: $V_{o.s3} := (E_{s.1} - E_{slab}) \cdot (W_{sc} - W_c - 2 \cdot t_{wc}) \cdot L_c = 14.41 \cdot m^3$

Total Volume of Soil on Outlet: $V_{o.s} := V_{o.s1} + V_{o.s2} + V_{o.s3} = 33.84 \cdot m^3$

Resultant Location of Outlet Soil:

$$R_{o.s} := \frac{\left[V_{o.s1} \cdot (L_{be} + L_{tc} - 400mm)\right] + \left[V_{o.s2} \cdot \left(L_{be} + L_{tc} + \frac{L_{ol.t}}{2}\right)\right] + \left[V_{o.s3} \cdot \left(L_{be} + L_{tc} - \frac{L_c}{2}\right)\right]}{V_{o.s}} = 16.76 \cdot m$$

Volume of Transition Soil: $V_{t.s} := 2 \cdot \left[0.5 \cdot (E_{s.1} + E_{s.t}) - E_{slab}\right] \cdot L_d \cdot t_o = 27.61 \cdot m^3$

Volume of Basin Soil: $V_{b.s} := 2 \cdot \left[0.5 \cdot (E_{s.t} + E_{s.2}) - E_{slab}\right] \cdot L_{be} \cdot t_o = 16.46 \cdot m^3$

Volume of Underslab Soil: $V_{u.s} := h_c \cdot \left[(W_{bs} - 2t_c) \cdot (L_{be} - t_c) + \left[\frac{1}{2}(W_{bs} + W_{hw}) - 2.t_c\right] \cdot L_t\right] - V_{tl} = 140.88 \cdot m^3$

Resultant of Underslab Soil: $R_{u.s} := R_s = 8.93 \cdot m$ (Approximate)

Transition Soil Resultant Loc.: $R_{t.s} := L_{be} + L_t - \frac{E_{s.1} + 2E_{s.t}}{3(E_{s.t} + E_{s.1})} \cdot L_t = 13.00 \cdot m$

Basin Soil Resultant Loc.: $R_{b.s} := \frac{2 \cdot L_{be}}{3} = 6.80 \cdot m$

Weight of Soil: $W_{soil} := \gamma_m \cdot (V_{o.s} + V_{t.s} + V_{b.s} + V_{u.s})$ $\boxed{W_{soil} = 4375.90 \cdot kN}$

Soil Weight Resultant Loc.: $R_{soil} := \frac{V_{o.s} \cdot R_{o.s} + V_{t.s} \cdot R_{t.s} + V_{b.s} \cdot R_{b.s} + V_{u.s} \cdot R_{u.s}}{\frac{W_{soil}}{\gamma_m}}$ $\boxed{R_{soil} = 10.49 \cdot m}$

Basin Water Weight (10 Year Flow):

Transition Effective Water Areas:

$$A_{tc.w} := \begin{bmatrix} \frac{1}{2}\left(W_b + W_c\right)L_{tc} \\ \frac{1}{2}W_c \cdot L_{tc} \\ \int_{0m}^{L_{tc}} \frac{1}{4}\frac{\left(W_b - W_c\right)}{L_{tc}}\left(2x - \frac{x^2}{L_{tc}}\right)dx \end{bmatrix} = \begin{pmatrix} 42.16 \\ 8.16 \\ 8.61 \end{pmatrix} \cdot m^2$$

Transition Water Depths:

$$E_{t.w.un} := \begin{pmatrix} E_{w.t.un} - E_{slab} \\ E_{w.1.un} - E_{w.t.un} \\ E_{w.1.un} - E_{w.t.un} \end{pmatrix} = \begin{pmatrix} 0.69 \\ 0.04 \\ 0.04 \end{pmatrix} \cdot m$$

Transition Water Volumes:

$$V_{t.w.un_i} := A_{tc.w_i} \cdot E_{t.w.un_i} \qquad V_{t.w.un} = \begin{pmatrix} 29.09 \\ 0.33 \\ 0.34 \end{pmatrix} \cdot m^3$$

Transition Water Resultant Locations:

$$R_{tc.w} := L_{be} + \begin{bmatrix} \frac{W_b + 2W_c}{3\left(W_c + W_b\right)} \cdot L_{tc} \\ \frac{2}{3}L_{tc} \\ L_{tc} - \frac{\int_{0m}^{L_{tc}} \frac{1}{4}\frac{\left(W_b - W_c\right)}{L_{tc}}\left(2x - \frac{x^2}{L_{tc}}\right)\cdot x\,dx}{\int_{0m}^{L_{tc}} \frac{1}{4}\frac{\left(W_b - W_c\right)}{L_{tc}}\left(2x - \frac{x^2}{L_{tc}}\right)dx} \end{bmatrix}$$

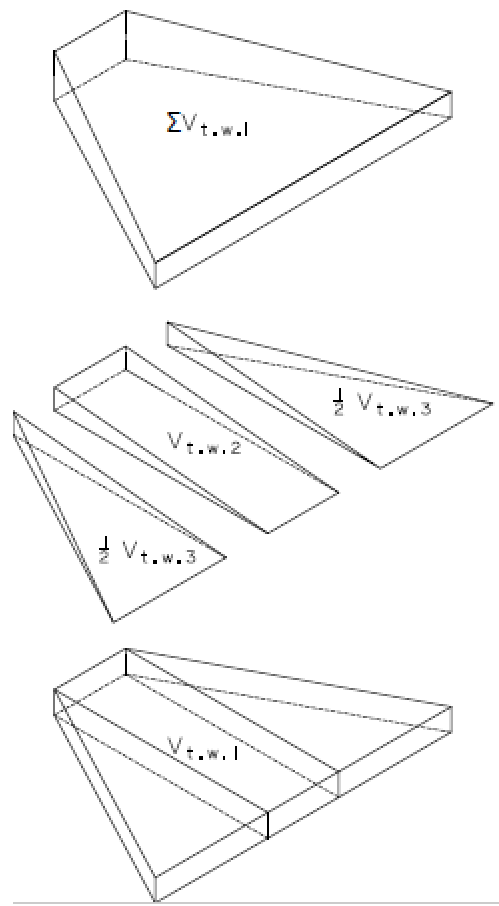

Figure: Transition Water Volumes

Transition Water Resultant: $R_{t.w} := \frac{\sum_i \left(V_{t.w.un_i} \cdot R_{tc.w_i}\right)}{\sum_i \left(V_{t.w.un_i}\right)} = 12.92 \cdot m$

Basin Water Result. Location: $R_{b.w} := L_{be} - \frac{E_{w.t.e} + 2E_{w.2.e}}{3\left(E_{w.2.e} + E_{w.t.e}\right)} L_{be} = 5.10 \cdot m$

Volume of Basin Water: $V_{b.w.un} := L_{be} \cdot W_b \cdot \left[0.5 \cdot \left(E_{w.t.un} + E_{w.2.un}\right) - E_{slab}\right] = 67.32 \cdot m^3$

Weight of Water 10 Year Flow: $W_{w.un} := \gamma_w \cdot \left[\sum_i \left(V_{t.w.un_i}\right) + V_{b.w.un}\right]$ $\boxed{W_{w.un} = 952.37 \cdot kN}$

Basin Water Weight (Max Flow):

Transition Water Depths: $E_{t.w.e} := \begin{pmatrix} E_{w.t.e} - E_{slab} \\ E_{w.1.e} - E_{w.t.e} \\ E_{w.1.e} - E_{w.t.e} \end{pmatrix} = \begin{pmatrix} 1.30 \\ 0.13 \\ 0.13 \end{pmatrix} \cdot m$

Transition Water Volumes: $V_{t.w.e_i} := A_{tc.w_i} \cdot E_{t.w.e_i}$ $\quad V_{t.w.e} = \begin{pmatrix} 54.72 \\ 1.08 \\ 1.14 \end{pmatrix} \cdot m^3$

Volume of Basin Water: $V_{b.w.e} := L_{be} \cdot W_b \cdot \left[0.5 \cdot \left(E_{w.t.e} + E_{w.2.e}\right) - E_{slab}\right] = 122.30 \cdot m^3$

Weight of Water Max Flow: $W_{w.e} := \gamma_w \cdot \left[\sum_i \left(V_{t.w.e_i}\right) + V_{b.w.e}\right]$ $\quad \boxed{W_{w.e} = 1758.30 \cdot kN}$

Water Resultant Location: $R_w := \dfrac{\sum_i \left(V_{t.w.e_i}\right) \cdot R_{t.w} + V_{b.w.e} \cdot R_{b.w}}{\dfrac{W_{w.e}}{\gamma_w}}$ $\quad \boxed{R_w = 7.59 \cdot m}$

Note: The water weight resultant locations varies slightly for the two load cases, but is negligible by inspection.

Uplift Force (10 Year Flow):

Uplift Head @ Outlet Ledge: $H_{u.ol.un} := E_{w.1.un} - \left(E_{slab} - t_{sc} - t_{ol}\right) = 2.83 \cdot m$

Outlet Ledge Uplift Area: $A_{ol.u} := W_{sc} \cdot \left(L_{ol.t} + L_c\right) = 11.76 \cdot m^2$

Outlet Ledge Uplift Force: $U_{ol.un} := \gamma_w \cdot H_{u.ol.un} \cdot A_{ol.u} = 326.57 \cdot kN$

Uplift Head @ Outlet: $H_{u.o.un} := E_{w.1.un} - \left(E_{slab} - t_s\right) = 1.48 \cdot m$

Uplift Head @ End of Basin: $H_{u.e.un} := E_{w.2.un} - \left(E_{slab} - t_s\right) = 1.38 \cdot m$

Uplift Head Slope: $H_{u.s.un} := \dfrac{H_{u.e.un} - H_{u.o.un}}{L_t + L_{be}} = -0.01$

Uplift Head @ End of Transition: $H_{u.t.un} := H_{u.o.un} + H_{u.s.un} \cdot L_t = 1.44 \cdot m$

Transition Effective Uplift Areas:

$$A_{t.u} := \begin{bmatrix} \frac{1}{2}\left(W_{bs} + W_{sc}\right) L_t \\ \frac{1}{2} W_{sc} \cdot L_t \\ \int_{0m}^{L_t} \frac{1}{4} \frac{\left(W_{bs} - W_{sc}\right)}{L_t} \left(2x - \frac{x^2}{L_t}\right) dx \end{bmatrix} = \begin{pmatrix} 50.49 \\ 16.89 \\ 5.57 \end{pmatrix} \cdot m^2$$

Transition Water Depths:

$$H_{u.tc} := \begin{pmatrix} H_{u.t.un} \\ H_{u.o.un} - H_{u.t.un} \\ H_{u.o.un} - H_{u.t.un} \end{pmatrix} = \begin{pmatrix} 1.44 \\ 0.04 \\ 0.04 \end{pmatrix} \cdot m$$

Transition Uplift Forces:

$$U_{t.un_i} := \gamma_w \cdot A_{t.u_i} \cdot H_{u.tc_i} \qquad U_{t.un} = \begin{pmatrix} 715.50 \\ 5.87 \\ 1.94 \end{pmatrix} \cdot kN \qquad \sum_i U_{t.un_i} = 723.31 \cdot kN$$

Transition Uplift Resultant Locations:

$$R_{u.tc} := L_{be} + \begin{bmatrix} \dfrac{W_{bs} + 2W_{sc}}{3(W_{sc} + W_{bs})} \cdot L_t \\ \dfrac{2}{3} L_t \\ L_t - \dfrac{\displaystyle\int_{0m}^{L_t} \frac{1}{4} \frac{(W_{bs} - W_{sc})}{L_t} \left(2x - \frac{x^2}{L_t}\right) x \, dx}{\displaystyle\int_{0m}^{L_t} \frac{1}{4} \frac{(W_{bs} - W_{sc})}{L_t} \left(2x - \frac{x^2}{L_t}\right) dx} \end{bmatrix}$$

Transition Uplift Resultant Location:

$$R_{t.u} := \frac{\displaystyle\sum_i \left(U_{t.un_i} \cdot R_{u.tc_i}\right)}{\displaystyle\sum_i \left(U_{t.un_i}\right)} = 12.70 \cdot m$$

Basin Uplift Force:

$$U_{b.un} := \gamma_w \cdot L_{be} \cdot W_{bs} \cdot \frac{1}{2}\left(H_{u.t.un} + H_{u.e.un}\right) = 1695.78 \cdot kN$$

Uplift Force Unusual Flow:

$$U_{un} := U_{ol.un} + \left(\sum_i U_{t.un_i}\right) + U_{b.un} \qquad \boxed{U_{un} = 2745.66 \cdot kN}$$

Horizontal Force From Uplift:

$$U_{un.h} := S_s \cdot \left[\left(\sum_i U_{t.un_i}\right) + U_{b.un}\right] \qquad \boxed{U_{un.h} = 43.54 \cdot kN}$$

Uplift Force (Max Flow):

Uplift Head @ Outlet Ledge: $H_{u.ol.e} := E_{w.1.e} - \left(E_{slab} - t_{sc} - t_{ol}\right) = 3.53 \cdot m$

Outlet Ledge Uplift Force: $U_{ol.e} := \gamma_w \cdot H_{u.ol.e} \cdot A_{ol.u} = 407.34 \cdot kN$

Uplift Head @ Outlet: $H_{u.o.e} := E_{w.1.e} - \left(E_{slab} - t_s\right) = 2.18 \cdot m$

Uplift Head @ End of Basin: $H_{u.e.e} := E_{w.2.e} - \left(E_{slab} - t_s\right) = 1.85 \cdot m$

Uplift Head Slope: $H_{u.s.e} := \dfrac{H_{u.e.e} - H_{u.o.e}}{L_t + L_{be}} = -0.02$

Uplift Head @ End of Transition: $H_{u.t.e} := H_{u.o.e} + H_{u.s.e} \cdot L_t = 2.06 \cdot m$

Transition Effective Uplift Areas:

$$A_{t.w} := \begin{bmatrix} \frac{1}{2}\left(W_{bs} + W_{sc}\right)L_t \\ \frac{1}{2} W_{sc} \cdot L_t \\ \displaystyle\int_{0m}^{L_t} \frac{1}{4} \cdot \frac{\left(W_{bs} - W_{sc}\right)}{L_t}\left(2x - \frac{x^2}{L_t}\right) dx \end{bmatrix} = \begin{pmatrix} 50.49 \\ 16.89 \\ 5.57 \end{pmatrix} \cdot m^2$$

Transition Water Depths:

$$H_{u.t} := \begin{pmatrix} H_{u.t.e} \\ H_{u.o.e} - H_{u.t.e} \\ H_{u.o.e} - H_{u.t.e} \end{pmatrix} = \begin{pmatrix} 2.06 \\ 0.12 \\ 0.12 \end{pmatrix} \cdot m$$

Transition Uplift Forces:

$$U_{t.e_i} := \gamma_w \cdot A_{t.w_i} \cdot H_{u.t_i} \qquad U_{t.e} = \begin{pmatrix} 1021.84 \\ 19.38 \\ 6.39 \end{pmatrix} \cdot kN \qquad \sum_i U_{t.e_i} = 1047.62 \cdot kN$$

Basin Uplift Force: $U_{b.e} := \gamma_w \cdot L_{be} \cdot W_{bs} \cdot \frac{1}{2}\left(H_{u.t.e} + H_{u.e.e}\right) = 2349.28 \cdot kN$

Basin Uplift Force React. Loc.: $R_{b.u} := L_{be} \cdot \dfrac{2H_{u.t.e} + H_{u.e.e}}{3 \cdot \left(H_{u.t.e} + H_{u.e.e}\right)} = 5.19 \cdot m$

Uplift Force Max Flow: $U_e := U_{ol.e} + \sum_i U_{t.e_i} + U_{b.e}$ $\boxed{U_e = 3804.24 \cdot kN}$

Horizontal Force From Uplift: $U_{e.h} := S_s \cdot \left(\sum_i U_{t.e_i} + U_{b.e}\right) = 61.14 \cdot kN$ $\boxed{U_{e.h} = 61.14 \cdot kN}$

Uplift Result. Loc.: $R_{up} := \dfrac{U_{ol.e} \cdot R_{cs} + \sum_i U_{t.e_i} \cdot R_{t.u} + U_{b.e} \cdot R_{b.u}}{U_e}$ $\boxed{R_{up} = 8.46 \cdot m}$

Note: Uplift resultant location is approximately the same (<1%) for both flow cases because uplift is linear for both

At-Rest Soil Force (Moist):

Headwall Soil Force:

$$F_{ha} := K_o \cdot \gamma_m \cdot \left(\frac{1}{2} \cdot h_h^{\,2} \cdot W_{hw}\right) = 149.88 \cdot kN$$

Transition Wall and Slab Soil Force:

$$F_{ta.u} := \frac{1}{2} \cdot K_o \cdot \gamma_m \cdot \left[0.5\left(E_{s.t} + E_{s.1}\right) - \left(E_{slab} - t_s\right)\right]^2 \cdot \left[\left(W_b + 2 \cdot t_w\right) - W_{hw}\right] = 921.29 \cdot kN$$

Outlet Soil Force:

$$F_{ol.u} := K_o \cdot \gamma_m \cdot \left[\left[W_{sc} - \left(W_c + 2t_{wc}\right)\right]\right] \cdot \left[h_h + \frac{1}{2}\left(t_{wc} + h_{oc} + t_{sc}\right)\right] \cdot \left(t_{wc} + h_{oc} + t_{sc}\right)\right] = 450.96 \cdot kN$$

Outlet Ledge Soil Force:

$$F_{ol2.u} := K_o \cdot \gamma_m \cdot W_{sc} \cdot \left(h_h + t_{wc} + h_{oc} + t_{sc} + \frac{t_{ol}}{2}\right) \cdot t_{ol} = 587.67 \cdot kN$$

Moist At-Rest Soil Force:

$$F_{a.u} := F_{ha} + F_{ta.u} + F_{ol.u} + F_{ol2.u} \qquad \boxed{F_{a.u} = 2109.79 \cdot kN}$$

At-Rest Soil Resultant Location:

$$R_a := \frac{\left[E_{wall.1} - \left(E_{slab} - t_s\right)\right]}{3} \qquad \boxed{R_a = 2.04 \cdot m}$$

At-Rest Soil Force (10 Year Flow):

Transition Wall Soil Force:

$$F_{ta.un} := \left[\left(W_b + 2 \cdot t_w\right) - W_{hw}\right] \cdot \left[\begin{array}{l} \frac{1}{2} \cdot K_o \cdot \gamma_s \cdot \left[0.5\left(E_{s.t} + E_{s.1}\right) - E_{w.1.un}\right]^2 \ldots \\ + K_o \cdot \gamma_s \cdot \left[0.5\left(E_{s.t} + E_{s.1}\right) - E_{w.1.un}\right] \cdot \left[E_{w.1.un} - \left(E_{slab} - t_s\right)\right] \ldots \\ + \frac{1}{2} \cdot K_o \cdot \gamma_{sub} \cdot \left[E_{w.1.un} - \left(E_{slab} - t_s\right)\right]^2 + \frac{1}{2} \cdot \gamma_w \cdot \left[E_{w.1.un} - \left(E_{slab} - t_s\right)\right]^2 \end{array}\right]$$

$$F_{ta.un} = 948.22 \cdot kN$$

Outlet Soil Force:

$$F_{ol.un} := \left[W_{sc} - \left(W_c + 2t_{wc}\right)\right] \cdot \left[\begin{array}{l} \frac{1}{2} K_o \cdot \gamma_s \cdot \left(E_{s.1} - h_h - E_{w.1.un}\right)^2 + K_o \cdot \gamma_m \cdot h_h \cdot \left(E_{s.1} - h_h - E_{w.1.un}\right) \ldots \\ + \frac{1}{2} K_o \cdot \gamma_{sub} \cdot \left[E_{w.1.un} - \left(E_{slab} - t_{sc}\right)\right]^2 \ldots \\ + K_o \cdot \gamma_s \cdot \left(E_{s.1} - E_{w.1.un}\right)\left[E_{w.1.un} - \left(E_{slab} - t_{sc}\right)\right] + \frac{1}{2} \gamma_w \cdot \left[E_{w.1.un} - \left(E_{slab} - t_{sc}\right)\right]^2 \end{array}\right]$$

$$F_{ol.un} = 462.88 \cdot kN$$

Outlet Ledge Soil Force:

$$F_{ol2.un} := W_{sc} \cdot \left[\begin{array}{l} \left[K_o \cdot \gamma_m \cdot \left(E_{s.1} - E_{w.1.un}\right) \cdot t_{ol}\right] + \left[K_o \cdot \gamma_{sub} \cdot \left[E_{w.1.un} - \left(E_{slab} - t_{sc}\right)\right] \cdot t_{ol}\right] \ldots \\ + \left(\frac{1}{2} K_o \cdot \gamma_{sub} \cdot t_{ol}^{\,2}\right) + \left[\gamma_w \cdot \left[E_{w.1.un} - \left(E_{slab} - t_{sc}\right)\right] \cdot t_{ol}\right] + \frac{1}{2} \cdot \gamma_w \cdot t_{ol}^{\,2} \end{array}\right]$$

$$F_{ol2.un} = 652.60 \cdot kN$$

10 Year Flow At-Rest Soil Force:

$$F_{a.un} := F_{ha} + F_{ta.un} + F_{ol.un} + F_{ol2.un} \qquad \boxed{F_{a.un} = 2213.58 \cdot kN}$$

At-Rest Soil Force (Max Flow):

Transition Wall Soil Force:

$$F_{ta.e} := \left[\left(W_b + 2 \cdot t_w\right) - W_{hw}\right] \cdot \left[\begin{array}{l} \frac{1}{2} \cdot K_o \cdot \gamma_s \cdot \left[0.5\left(E_{s.t} + E_{s.1}\right) - E_{w.1.e}\right]^2 \cdots \\ + K_o \cdot \gamma_s \cdot \left[0.5\left(E_{s.t} + E_{s.1}\right) - E_{w.1.e}\right] \cdot \left[E_{w.1.e} - \left(E_{slab} - t_s\right)\right] \cdots \\ + \frac{1}{2} \cdot K_o \cdot \gamma_{sub} \cdot \left[E_{w.1.e} - \left(E_{slab} - t_s\right)\right]^2 + \frac{1}{2} \cdot \gamma_w \cdot \left[E_{w.1.e} - \left(E_{slab} - t_s\right)\right]^2 \end{array}\right]$$

$$F_{ta.e} = 979.72 \cdot kN$$

Outlet Soil Force:

$$F_{ol.e} := \left[W_{sc} - \left(W_c + 2t_{wc}\right)\right] \cdot \left[\begin{array}{l} \frac{1}{2} K_o \cdot \gamma_s \cdot \left(E_{s.1} - h_h - E_{w.1.e}\right)^2 + K_o \cdot \gamma_m \cdot h_h \cdot \left(E_{s.1} - h_h - E_{w.1.e}\right) \cdots \\ + \frac{1}{2} K_o \cdot \gamma_{sub} \cdot \left[E_{w.1.e} - \left(E_{slab} - t_{sc}\right)\right]^2 \cdots \\ + K_o \cdot \gamma_s \cdot \left(E_{s.1} - E_{w.1.e}\right)\left[E_{w.1.e} - \left(E_{slab} - t_{sc}\right)\right] + \frac{1}{2} \gamma_w \cdot \left[E_{w.1.e} - \left(E_{slab} - t_{sc}\right)\right]^2 \end{array}\right]$$

$$F_{ol.e} = 475.33 \cdot kN$$

Outlet Ledge Soil Force:

$$F_{ol2.e} := W_{sc} \cdot \left[\begin{array}{l} \left[K_o \cdot \gamma_m \cdot \left(E_{s.1} - E_{w.1.e}\right) \cdot t_{ol}\right] + \left[K_o \cdot \gamma_{sub} \cdot \left[E_{w.1.e} - \left(E_{slab} - t_{sc}\right)\right] \cdot t_{ol}\right] \cdots \\ + \left(\frac{1}{2} K_o \cdot \gamma_{sub} \cdot t_{ol}^2\right) + \left[\gamma_w \cdot \left[E_{w.1.e} - \left(E_{slab} - t_{sc}\right)\right] \cdot t_{ol}\right] + \frac{1}{2} \cdot \gamma_w \cdot t_{ol}^2 \end{array}\right]$$

$$F_{ol2.e} = 672.98 \cdot kN$$

Max Flow At-Rest Soil Force: $F_{a.e} := F_{ha} + F_{ta.e} + F_{ol.e} + F_{ol2.e}$ $\boxed{F_{a.e} = 2277.90 \cdot kN}$

Resisting (At-Rest) Soil Force at End of Basin:

Note: Ignore water flow over soil at end of basin

Passive Soil Force at Cutoff: $F_p := 0.5K_o \gamma_m \cdot \left(t_s + h_c\right)^2 \cdot W_{bs}$ $\boxed{F_p = 216.82 \cdot kN}$

Passive Soil Resultant Location: $R_p := \frac{1}{3}\left(h_c + t_s\right)$ $\boxed{R_p = 0.58 \cdot m}$

Surcharge Force:

Surcharge Force:

$$F_{sur} := K_o \cdot \gamma_m \cdot H_s \cdot \left[\begin{array}{l} \left[0.5\left(E_{s.t} + E_{s.1}\right) - \left(E_{slab} - t_s\right)\right] \cdot \left[\left(W_b + 2t_w\right) - W_{hw}\right] + h_h \cdot W_{hw} \cdots \\ + \left[E_{s.1} - \left(E_{slab} - t_{sc}\right)\right] \cdot \left(W_{sc} - W_{hw}\right) + t_{ol} \cdot W_{sc} \end{array}\right]$$

$$\boxed{F_{sur} = 666.36 \cdot kN}$$

Surcharge Resultant Location: $R_{sur} := 0.5 \cdot \left[E_{s.1} - \left(E_{slab} - t_s\right)\right]$ $\boxed{R_{sur} = 3.07 \cdot m}$

Note: R_{sur} is slightly higher than the actual resultant due to varying soil height along the transition wall.

Dynamic Water Force:

Note: Water Velocity Based on Max Flow, but also use for 10 Year Flow

Total Drag Force: $F_d := 0.5 \cdot C_d \cdot \frac{\gamma_w}{g} \cdot n_{bb} \cdot H_{bb} \cdot W_{bb} \cdot V^2$ $\boxed{F_d = 681.00 \cdot kN}$

Drag Force Resultant Location: $R_d := 0.5 \cdot H_{bb} + t_s$ $\boxed{R_d = 0.93 \cdot m}$

Seismic Forces (Case a, K = 1.0*Kh + 0.0*Kv):

Horizontal Inertia Force: $Q_{h.i.a} := K_{h.a} \cdot W_s$ $\boxed{Q_{h.i.a} = 1187.57 \cdot kN}$

Vertical Inertia Force: $Q_{v.i.a} := K_{v.a} \cdot W_s$ $\boxed{Q_{v.i.a} = 0.00 \cdot kN}$

Horizontal Soil Force:

$$Q_{h.s.a} := K_{h.a} \cdot \gamma_m \cdot \begin{bmatrix} h_h^{\,2} \cdot (W_c + 2t_{wc}) + [E_{s.1} - (E_{slab} - t_{sc} - t_{ol})] \cdot t_{ol} \cdot (W_c + 2t_{wc}) \ldots \\ + [E_{s.1} - (E_{slab} - t_{sc} - t_{ol})]^2 \cdot [W_{hw} - (W_c + 2t_{wc})] \ldots \\ + [0.5(E_{s.t} + E_{s.1}) - (E_{slab} - t_s - h_c)]^2 \cdot (W_b + 2 \cdot t_w - W_{hw}) \ldots \\ + [E_{s.t} - [E_{slab} - 0.5(t_s + h_c)]] \cdot (t_s + h_c) \cdot 2 \cdot t_o + (t_s + h_c)^2 \cdot W_{bs} \end{bmatrix}$$

$\boxed{Q_{h.s.a} = 1428.57 \cdot kN}$

Vertical Inertia Force Resultant Location: $R_{q.v} := R_s = 8.93 \cdot m$ $\boxed{R_{q.v} = 8.93 \cdot m}$

Horiz. Inertia Force Resultant Location:

$$R_{q.h.i} := \frac{(V_{cs} + V_{ts} + V_{bs}) \cdot 0.5 \cdot t_s - V_c \cdot 0.5 \cdot h_c + V_{bw} \cdot \left[\frac{0.5 \cdot h_e^{\,2} + 0.5 \cdot (h_t - h_e) \cdot [h_e + 0.333 \cdot (h_t - h_e)]}{h_e + 0.5 \cdot (h_t - h_e)} + t_s\right] \ldots \\ + V_{tw} \cdot (t_s + 0.5 \cdot h_t) + V_{cw} \cdot [t_s + 0.5 \cdot (h_{oc} + t_{wc})] + V_{hw} \cdot (t_s + h_{oc} + t_{wc} + 0.5 \cdot h_h) + V_{bb} \cdot 0.5 \cdot H_{bb}}{V_{cs} + V_{ts} + V_{bs} + V_c + V_{bw} + V_{tw} + V_{cw} + V_{hw} + V_{bb}}$$

$\boxed{R_{q.h.i} = 1.38 \cdot m}$

Horiz. Soil Force Resultant Location: $R_{q.h.s} := 0.63 \cdot [E_{s.1} - (E_{slab} - t_s)] = 3.86 \cdot m$ $\boxed{R_{q.h.s} = 3.86 \cdot m}$

Notes: - Resultant location from Design Basis Memorandum
- Seismic resultant locations are the same for all seismic cases
- The Horizontal Soil Force Resultant Location is conservatively higher than the actual resultant location.

Seismic Forces (Case b, K = 1.0*Kh + 0.3*Kv):

Horizontal Inertia Force: $Q_{h.i.b} := K_{h.b} \cdot W_s$ $\boxed{Q_{h.i.b} = 1187.57 \cdot kN}$

Vertical Inertia Force: $Q_{v.i.b} := K_{v.b} \cdot W_s$ $\boxed{Q_{v.i.b} = 199.51 \cdot kN}$

Horizontal Soil Force:

$$Q_{h.s.b} := K_{h.b} \cdot \gamma_m \cdot \begin{bmatrix} h_h^{\,2} \cdot (W_c + 2t_{wc}) + \left[E_{s.1} - (E_{slab} - t_{sc} - t_{ol})\right] \cdot t_{ol} \cdot (W_c + 2t_{wc}) \ldots \\ + \left[E_{s.1} - (E_{slab} - t_{sc} - t_{ol})\right]^2 \cdot \left[W_{hw} - (W_c + 2t_{wc})\right] \ldots \\ + \left[0.5(E_{s.t} + E_{s.1}) - (E_{slab} - t_s - h_c)\right]^2 \cdot (W_b + 2 \cdot t_w - W_{hw}) \ldots \\ + \left[E_{s.t} - \left[E_{slab} - 0.5(t_s + h_c)\right]\right] \cdot (t_s + h_c) \cdot 2 \cdot t_o + (t_s + h_c)^2 \cdot W_{bs} \end{bmatrix}$$

$\boxed{Q_{h.s.b} = 1428.57 \cdot kN}$

Seismic Forces (Case c, K = 0.3*Kh + 1.0*Kv):

Horizontal Inertia Force: $Q_{h.i.c} := K_{h.c} \cdot W_s$ $\boxed{Q_{h.i.c} = 356.27 \cdot kN}$

Vertical Inertia Force: $Q_{v.i.c} := K_{v.c} \cdot W_s$ $\boxed{Q_{v.i.c} = 665.04 \cdot kN}$

Horizontal Soil Force:

$$Q_{h.s.c} := K_{h.c} \cdot \gamma_m \cdot \begin{bmatrix} h_h^{\,2} \cdot (W_c + 2t_{wc}) + \left[E_{s.1} - (E_{slab} - t_{sc} - t_{ol})\right] \cdot t_{ol} \cdot (W_c + 2t_{wc}) \ldots \\ + \left[E_{s.1} - (E_{slab} - t_{sc} - t_{ol})\right]^2 \cdot \left[W_{hw} - (W_c + 2t_{wc})\right] \ldots \\ + \left[0.5(E_{s.t} + E_{s.1}) - (E_{slab} - t_s - h_c)\right]^2 \cdot (W_b + 2 \cdot t_w - W_{hw}) \ldots \\ + \left[E_{s.t} - \left[E_{slab} - 0.5(t_s + h_c)\right]\right] \cdot (t_s + h_c) \cdot 2 \cdot t_o + (t_s + h_c)^2 \cdot W_{bs} \end{bmatrix}$$

$\boxed{Q_{h.s.c} = 428.57 \cdot kN}$

STABILITY ANALYSIS

	Usual	**Unusual**	**Extreme**
Resultant Location Required (DBM Table 7):	$R_{u.u} := 0.333$	$R_{u.un} := 0.333$	$R_e := 0.5$

TITLE: LLOW GRAVITY CONDUIT ANALYSIS – LOAD CONDITION U1

Author: E. Farfan
Project: SR-1
Project No.: 110773396
Date: 9/23/2019
Drawing: S-400

INTRODUCTION

This report provides an analysis of the forces acting on the walls of the Low-Level Outlet Works (LLOW) gravity conduit. The LLOW is a gated gravity drainage structure located within the banks of the Unnamed Creek and constructed through the embankment dam.

The LLOW conduit structure comprised of a cast-on-place reinforced concrete placed on an excavated channel that will be filled to the existing ground elevation. The walls of the excavation are far apart that the effects on the structure of the interaction between the native soil and the fill can be neglected in the analysis.

The acting forces on the LLOW gravity conduit are evaluated using a finite element model (FEM). The analysis validation is performed by comparing the resultant forces obtained with the FE analysis and results using the Direct Design method as described in ASCE 15-17.

The module Sigma/W from the computer program GeoStudio (2018) was used for the FE analysis.

OBJECTIVES

Determine the forces acting on the LLOW structure using an FE analysis and verify the results using the Direct Design method (ASCE 15-17).

GEOMETRY

The location of the cross-section selected to represent the highest overburden over the LLOW gravity conduit was located near the crest of the embankment on the downstream side from the embankment centerline as depicted in Figure 1.

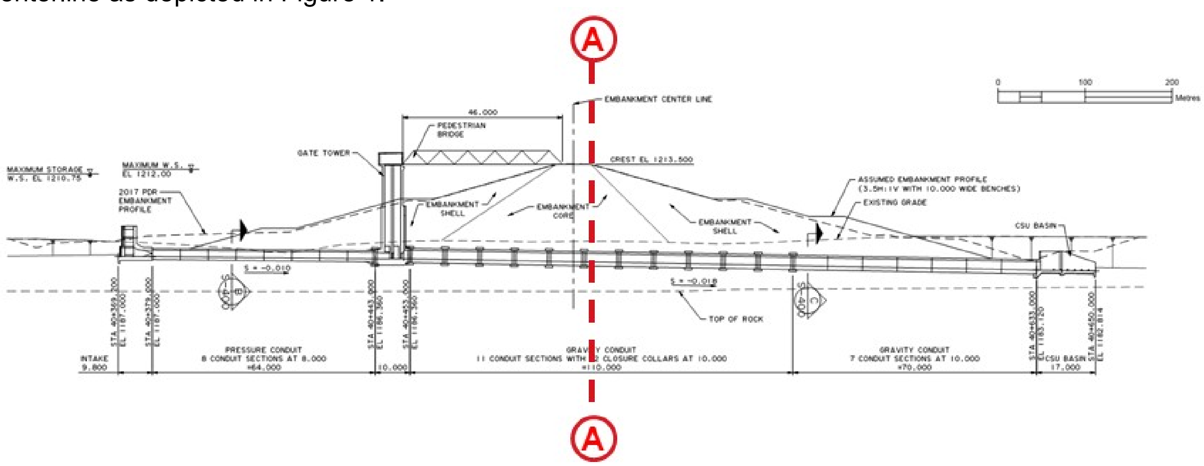

Figure 1. Location of the cross-section considered for the FE analysis.

The geometry of the LLOW gravity conduit is provided in Figure 2.

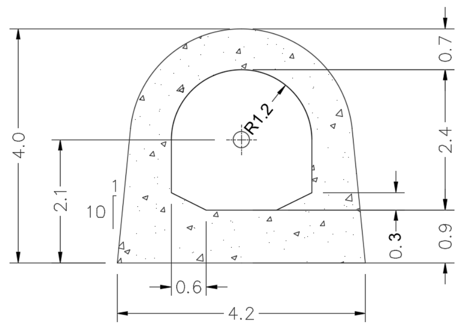

Figure 2. LLOW gravity conduit geometry (dimensions in meters).

Figure 3 shows the soil profile at section A-A.

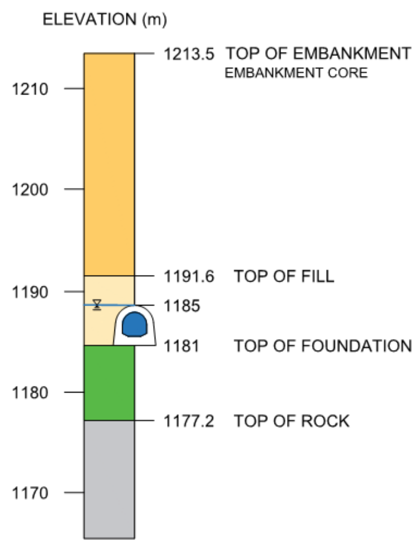

Figure 3. Soil profile at Section A-A.

MODEL DETAILS

The FE model (FEM) comprised of a region of 24.2m wide (or 5.8 times the structure size) and 36.6m in-depth (or 9 times the structure size). The region is discretized using a 1m global element size and a mix of quad and triangle unstructured mesh (see figure 4).

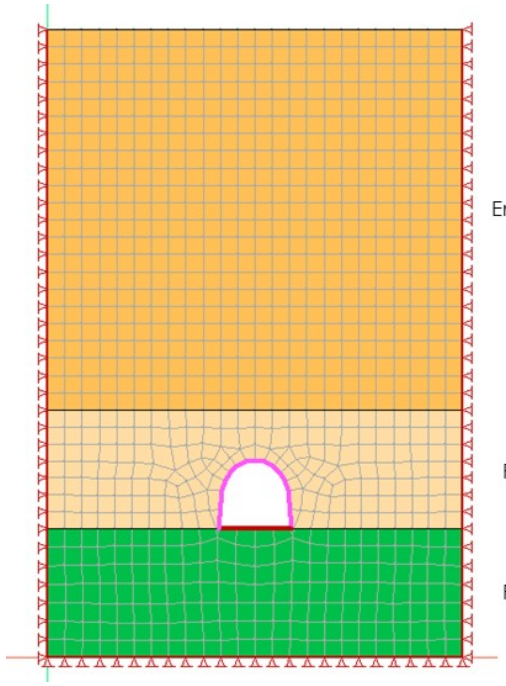

Figure 4. Mixed quad and triangle unstructured mesh (1m size element)

The discretization of the region resulted in 936 nodes and approximate 870 elements. The analysis is performed using a 2D model with 3 degrees of freedom at each node (displacement [x, y directions], and pore-water pressure). The model does not allow slip between the soil and the structural beams, this assumption results in higher stresses on the structure if slip was allowed to occur.

The groundwater table was set at the same elevation of the top of the conduit.

Material Data

Soil materials are modeled using elastic-plastic elements under drained conditions. Table 1 summarizes the soil parameters considered in the FEM.

Table 1. Soil parameters

Elevation (m)	*Depth (m)*	*Description*	*Unit weight (kN/m3)*	*c (kPa)*	*φ (deg)*	*E (MPa)*	*μ*
1213.5	0.0	Embankment Core	20	0	28	17	0.35
1185.0	28.5	Fill	20	0	24	10	0.35
1181.0	4.0	Foundation	18	0	27	17	0.35
1177.2	3.8	Rock	Uncompressible				

The conduit was modeled using structural beams. Table 2 summarizes the parameters used to model the conduit walls. The modulus of elasticity was calculated using a block of concrete with compressive strength equal to 30 MPa.

Table 2. Gravity conduit model parameters

Location	*Ec (MPa)*	*A (m^2)*	*Ixx (m^4)*
Top Section	24647.5	0.70	0.029
Bottom Section	24647.5	0.90	0.061

LOADS

Only the effect of gravity as a body load was considered in the analysis.

CONSTRAINS

The model was constrained from lateral movement on the side boundaries and axial movement at the bottom boundary (see figure 4).

RESULTS

The results of the FEA are presented in Figure 5 and summarized in Table 3. Figure 5 shows the diagrams for the moment, shear and axial forces respectively.

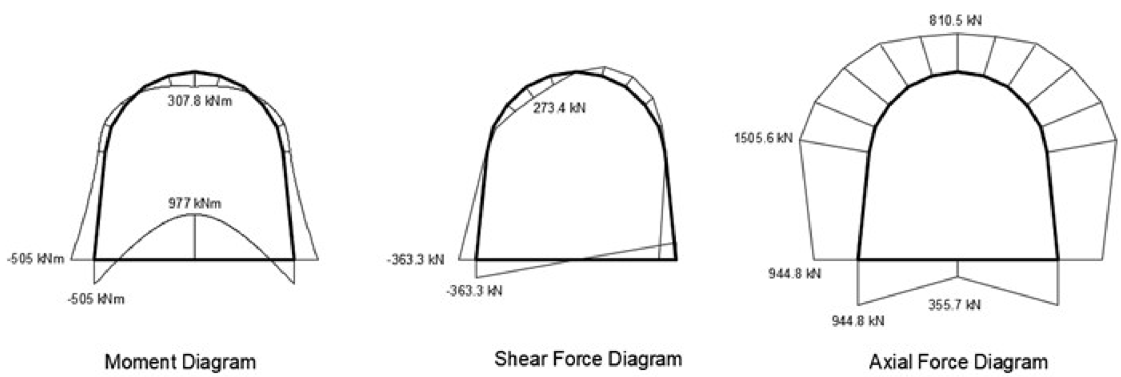

Figure 5. Moment, Shear and axial forces diagrams.

Table 3. Summary of resultant forces.

Location	*Max. Moment (kNm)*	*Max. Shear Force (kN)*	*Max. Axial Force (kN)*
Top Section	307.8	363.3	1505.6
Bottom Section	977.0	363.3	944.8

FEA RESULTS VALIDATION

Calculations of the forces acting on the gravity conduit due to the embankment surcharge using the Direct Design approach are presented in Attachment A.

The Direct Design method, also referred to as the Heger Pressure Distribution, provides a set of factors associated with a load distribution diagram to estimate the soil pressures acting on the conduit. The load factors are related to four types of installation. The type of installation has a significant effect on the loads carried by the conduit.

For this analysis, installation Type 1 is assumed. Type 1 installation comprises of 170 mm of bedding (Diameter/24) of compacted gravely-sand per specifications. The fill could range between the specified soil categories as long the minimum percentage of compaction is observed.

Figure 6 summarizes the comparison between the resultant forces from the FEM and the best estimated resultant forces from the Direct Design method.

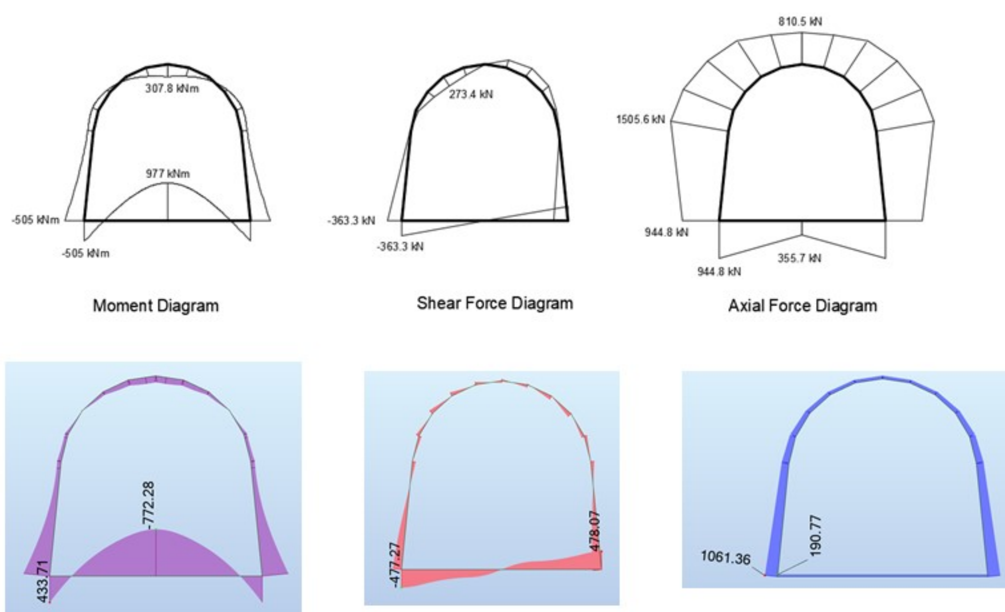

Figure 6. Comparison between FEM and Direct Design method.

CONCLUSIONS

The resultant forces on the gravity conduit calculated using the FEM (GeoStudio) are comparable with the resultant forces calculated using the Direct Design method.

TITLE: LLOW GRAVITY CONDUIT ANALYSIS – LOAD CONDITION UN1

Author: E. Farfan
Project: SR-1
Project No.: 110773396
Date: 10/23/2019
Drawing: S-400

INTRODUCTION

This report provides an analysis of the forces acting on the walls of the Low-Level Outlet Works (LLOW) gravity conduit. The LLOW is a gated gravity drainage structure located within the banks of the Unnamed Creek and constructed through the embankment dam.

The LLOW conduit structure comprised of a cast-on-place reinforced concrete placed on an excavated channel that will be filled to the existing ground elevation. The walls of the excavation are far apart that the effects on the structure of the interaction between the native soil and the fill can be neglected in the analysis.

The acting forces on the LLOW gravity conduit are evaluated using a finite element model (FEM). The module Sigma/W from the computer program GeoStudio (2018) was used for the FE analysis.

OBJECTIVES

Determine the forces acting on the LLOW structure using an FE analysis.

GEOMETRY

The location of the cross-section selected to represent the highest overburden over the LLOW gravity conduit was located near the crest of the embankment on the downstream side from the embankment centerline as depicted in Figure 1.

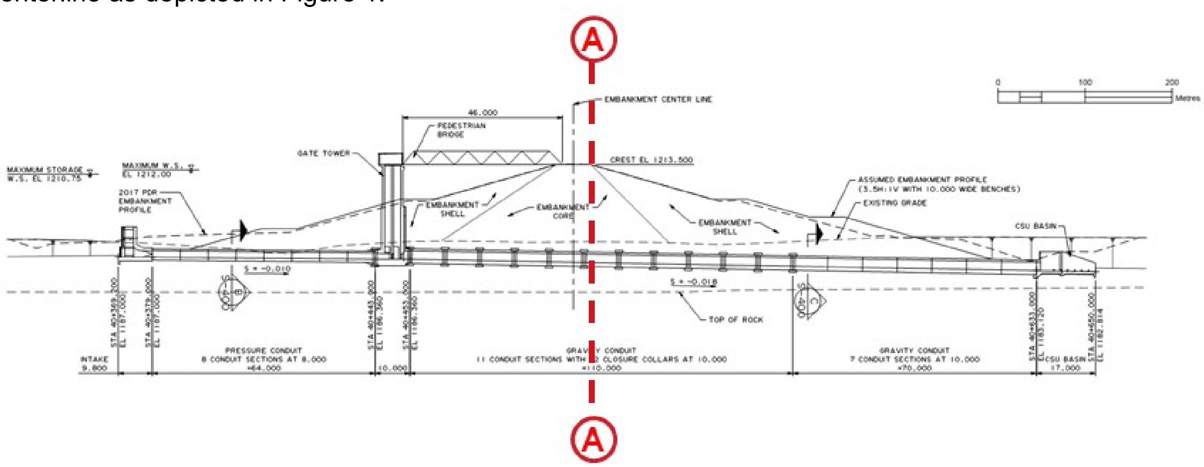

Figure 1. Location of the cross-section considered for the FE analysis.

The geometry of the LLOW gravity conduit is provided in Figure 2.

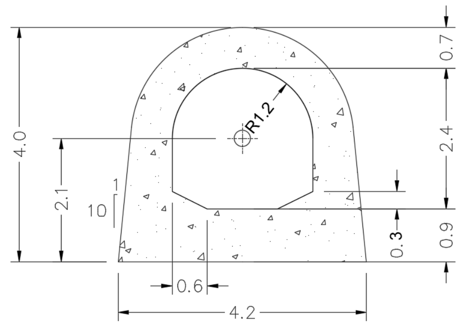

Figure 2. LLOW gravity conduit geometry (dimensions in meters).

Figure 3 shows the soil profile at section A-A.

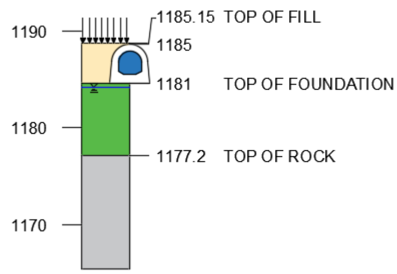

Figure 3. Soil profile at Section A-A.

MODEL DETAILS

The FE model (FEM) comprised of a region of 24.2m wide (or 5.8 times the structure size) and 11.7m in-depth (or 2.9 times the structure size). The region is discretized using a 1m global element size and a mix of quad and triangle unstructured mesh (see figure 4).

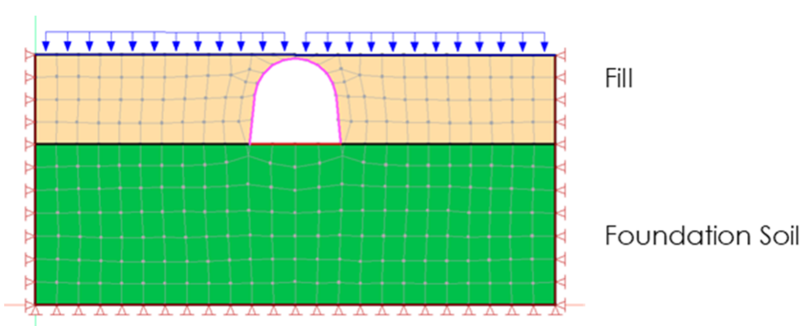

Figure 4. Mixed quad and triangle unstructured mesh (1m size element)

The discretization of the region resulted in 308 nodes and approximate 263 elements. The analysis is performed using a 2D model with 3 degrees of freedom at each node (displacement [x, y directions], and pore-water pressure). The model does not allow slip between the soil and the structural beams, this assumption results in higher stresses on the structure if slip was allowed to occur.

The groundwater table was set at the same elevation of the top of the conduit.

Material Data

Soil materials are modeled using elastic-plastic elements under drained conditions. Table 1 summarizes the soil parameters considered in the FEM.

Table 1. Soil parameters

Elevation (m)	*Depth (m)*	*Description*	*Unit weight (kN/m3)*	*c (kPa)*	*φ (deg)*	*E (MPa)*	*μ*
1185.15	28.5	Fill	20	0	24	10	0.35
1181.0	4.0	Foundation	18	0	27	17	0.35
1177.2	3.8	Rock	Uncompressible				

The conduit was modeled using structural beams. Table 2 summarizes the parameters used to model the conduit walls. The modulus of elasticity was calculated using a block of concrete with compressive strength equal to 30 MPa.

Table 2. Gravity conduit model parameters

Location	*Ec (MPa)*	*A (m^2)*	*Ixx (m^4)*
Top Section	24647.5	0.70	0.029
Bottom Section	24647.5	0.90	0.061

LOADS

The effect of gravity as a body load and a traffic load (15 kPa) were considered in the analysis.

CONSTRAINS

The model was constrained from lateral movement on the side boundaries and axial movement at the bottom boundary (see figure 4).

RESULTS

The results of the FEA are presented in Figure 5 and summarized in Table 3. Figure 5 shows the diagrams for the moment, shear and axial forces respectively.

INTRODUCTION

This report provides an analysis of the forces acting on the walls of the Low-Level Outlet Works (LLOW) gravity conduit. The LLOW is a gated gravity drainage structure located within the banks of the Unnamed Creek and constructed through the embankment dam.

The LLOW conduit structure comprised of a cast-on-place reinforced concrete placed on an excavated channel that will be filled to the existing ground elevation. The walls of the excavation are far apart that the effects on the structure of the interaction between the native soil and the fill can be neglected in the analysis.

The acting forces on the LLOW gravity conduit are evaluated using a finite element model (FEM). The analysis validation is performed by comparing the resultant forces obtained with the FE analysis and results using the Direct Design method as described in ASCE 15-17.

The module Sigma/W from the computer program GeoStudio (2018) was used for the FE analysis.

OBJECTIVES

Determine the forces acting on the LLOW structure using an FE analysis and verify the results using the Direct Design method (ASCE 15-17).

GEOMETRY

The location of the cross-section selected to represent the highest overburden over the LLOW gravity conduit was located near the crest of the embankment on the downstream side from the embankment centerline as depicted in Figure 1.

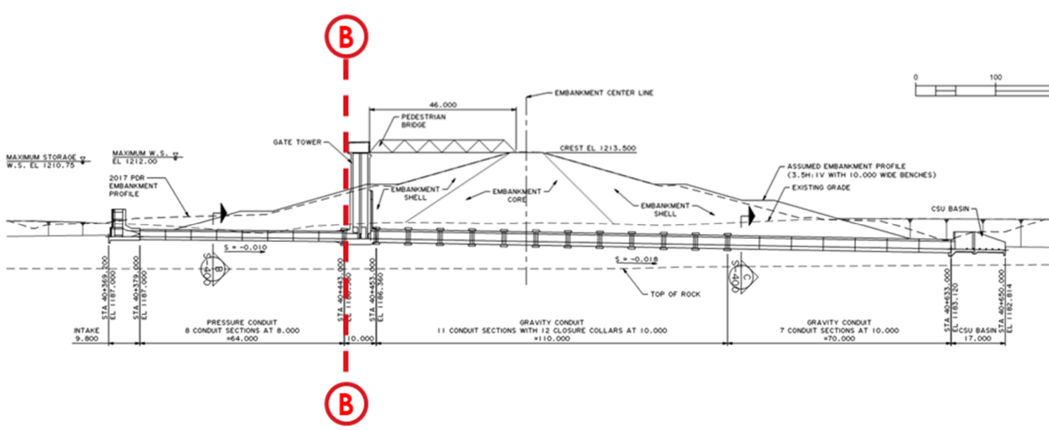

Figure 1. Location of the cross-section considered for the FE analysis.

The geometry of the LLOW gravity conduit is provided in Figure 2.

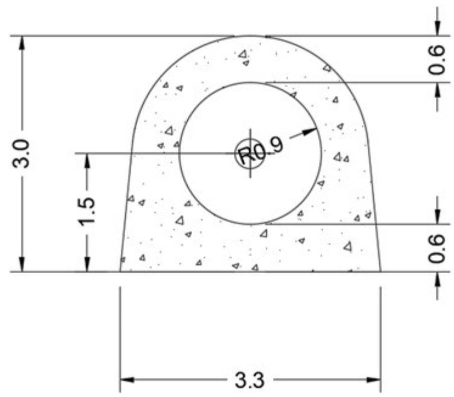

Figure 2. LLOW gravity conduit geometry (dimensions in meters).

Figure 3 shows the soil profile at section A-A.

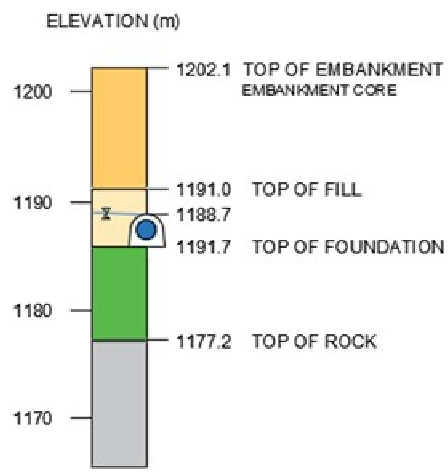

Figure 3. Soil profile at Section A-A.

MODEL DETAILS

The FE model (FEM) comprised of a region of 24.2m wide (or 5.8 times the structure size) and 36.6m in-depth (or 9 times the structure size). The region is discretized using a 1m global element size and a mix of quad and triangle unstructured mesh (see figure 4).

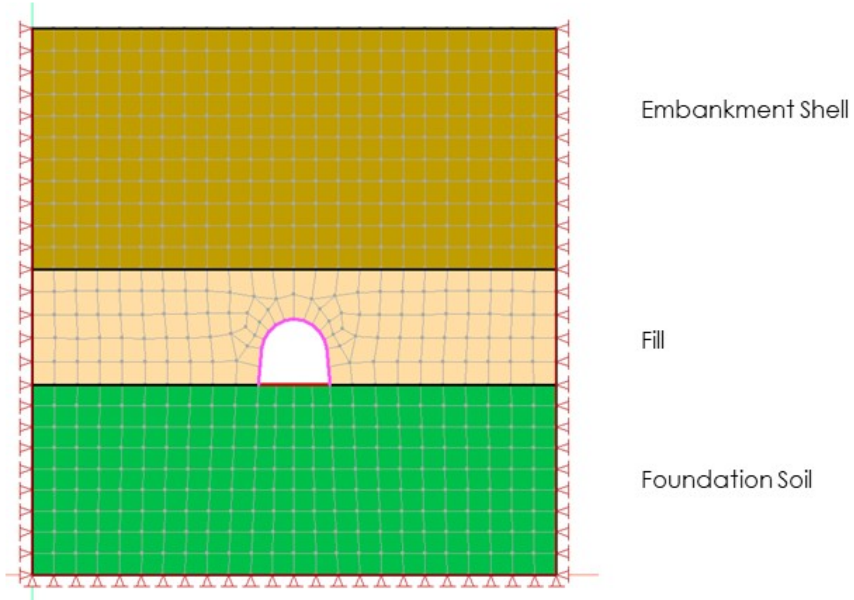

Figure 4. Mixed quad and triangle unstructured mesh (1m size element)

The discretization of the region resulted in 936 nodes and approximate 870 elements. The analysis is performed using a 2D model with 3 degrees of freedom at each node (displacement [x, y directions], and pore-water pressure). The model does not allow slip between the soil and the structural beams, this assumption results in higher stresses on the structure if slip was allowed to occur.

The groundwater table was set at the same elevation of the top of the conduit.

Material Data

Soil materials are modeled using elastic-plastic elements under drained conditions. Table 1 summarizes the soil parameters considered in the FEM.

Table 1. Soil parameters

Top Section	119.7	145.5	649.4
Bottom Section	270.4	140.8	438.4

FEA RESULTS VALIDATION

Calculations of the forces acting on the gravity conduit due to the embankment surcharge using the Direct Design approach are presented in Attachment A.

The Direct Design method, also referred to as the Heger Pressure Distribution, provides a set of factors associated with a load distribution diagram to estimate the soil pressures acting on the conduit. The load factors are related to four types of installation. The type of installation has a significant effect on the loads carried by the conduit.

For this analysis, installation Type 1 is assumed. Type 1 installation comprises of 170 mm of bedding (Diameter/24) of compacted gravely-sand per specifications. The fill could range between the specified soil categories as long the minimum percentage of compaction is observed.

Figure 6 summarizes the comparison between the resultant forces from the FEM and the best estimated resultant forces from the Direct Design method.

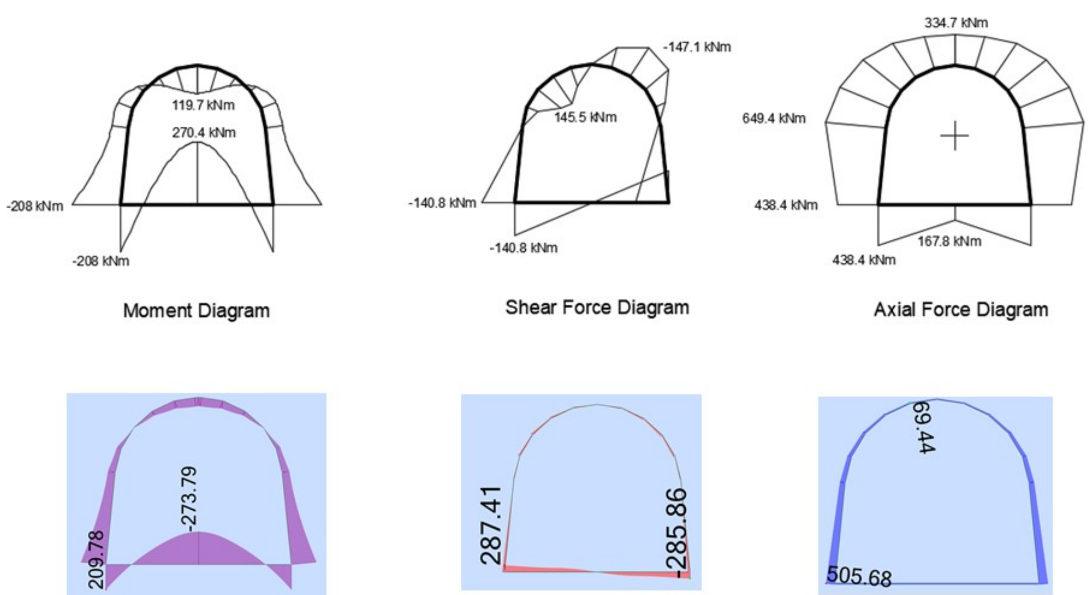

Figure 6. Comparison between FEM and Direct Design method.

CONCLUSIONS

The resultant forces on the gravity conduit calculated using the FEM (GeoStudio) are comparable with the resultant forces calculated using the Direct Design method.

1.0 INTRODUCTION

1.1 PURPOSE

This Structural Design Report (SDR) describes stability assessment, structural analyses and design of the Debris Deflection Barrier (DDB), which is part of the Springbank Off-stream Storage Project (SR1). The SDR consolidates and documents the design philosophy, relevant criteria, primary design parameters, and reference source of data used for design. The Debris Deflection Barrier was sized to meet stability requirements and major structural members were designed for conformance with structural criteria.

1.2 PROJECT OVERVIEW

SR1 is a flood diversion system comprised of a diversion structure, a diversion channel and off-stream dry storage reservoir (no permanent pool). When in operation, SR1 will divert and temporarily store excess flood water from the Elbow River and release it back into the river system in a controlled manner. SR1 will work in tandem with the downstream Glenmore Reservoir to limit flood flows downstream of Glenmore to less than 170 m^3/s for up to SR1's design event - the 2013 flood or its equivalent.

Elements of the project are:

- Diversion Structure on the Elbow River consisting of, from left to right when looking downstream, gated Diversion Inlet structure leading to a Diversion Channel, gated Service Spillway located on the Elbow River, adjacent Auxiliary Spillway and a Floodplain Berm. A Debris Deflection Barrier is in the headwater of the Diversion Structure to protect the Diversion Inlet from flood debris.

- Diversion Channel leading from the Elbow River at the Diversion Inlet to the Off-stream Storage Reservoir with an Emergency Spillway along the channel and Channel Outlet at end of the channel.

- Off-stream Storage Dam with Low-Level Outlet Works.

1.3 DESIGN OBJECTIVES

The primary objective of the DDB is to reduce the risks that large debris pose to the operation of the Diversion Inlet gates during a flood event, and to the bridge piers and other structures in the Diversion Channel. The alignment of the barrier, parallel to the river, promotes the passage of debris through the Service Spillway and downstream into the Elbow River.

The structure will normally be in a dry condition except during flood events. After flood events, debris removal from the Debris Deflection Barrier and Service Spillway will be needed. After each event, the DDB may be damaged as the debris impacts the structure and repairs may be needed to restore any damaged portions of the frame. The DBB can be envisioned as a large trash rack as with trash racks maintenance is key. The DDB is a secondary system and is not the primary flood control structure.

1.4 GENERAL ARRANGEMENT

The DDB consists of a steel framed post and horizontal beam system bearing on a concrete foundation. The concrete foundation bears on the rock subgrade and incorporates a tension component using drilled shafts. The structure is 165-m-long with a variable height concrete foundation wall surmounted by a 5.75-metre-tall steel frame. The structure is divided into 10.0 m panels consisting of four vertical posts, a horizontal cross brace at the top and six or seven horizontal pipes mounted to the steel vertical members. The horizontal members of the frame are comprised of hollow steel structural piping spaced 750 mm apart.

The concrete foundation wall forms the left bank of the Elbow River and extends from rock to the 1:2 -year water surface. This ranges from Elevation 1211.5 m at the Service Spillway upstream to Elevation 1212.0 at the left Elbow River abutment. The top of the frame is set to Elevation 1217.25 m: the Probable Maximum Flood in the Elbow River assuming no diversion.

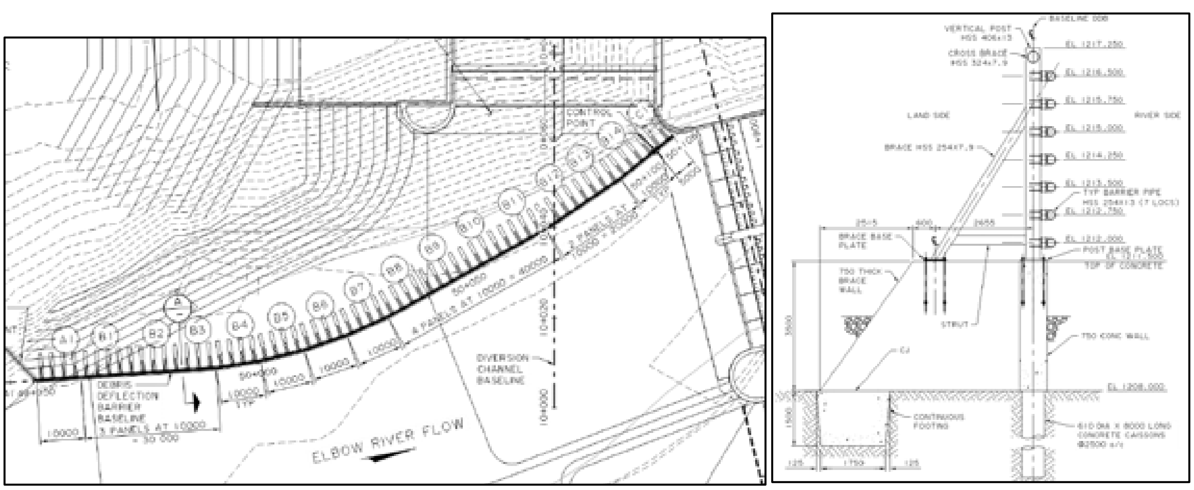

Figure 1. Plan and Section of Debris Deflection Barrier

1.5 BASIS FOR STRUCTURE LAYOUT

The DDB layout is based on physical hydraulic model studies and computational hydrotechnical evaluations to establish overall geometry and layout angles. The orientation was selected based on physical hydraulic modelling results. The loading was assessed by computational fluid dynamic (CFD) modelling and debris assessment. The foundation was designed in such way with a goal to reduce uplift while providing rigidity to the structure with the connection between the drilled shafts and the footings. The space between the rack steel pipes was selected based on CFD modelling. The rack spaces permit water to flow through the barrier while still having a barrier to limit passage of large debris before entering the Diversion Channel. The spacing between the vertical posts was determined to be 2.5 metres based on preliminary element sizing, layout, buildability and to avoid side by side posts at module ends.

2.0 CODES AND STANDARDS

In accordance with "terms of reference" for this project, the design complies with current Alberta Transportation (AT) Design Standards and current AT Design and Construction Bulletins. By reference in AT Standards, Canadian Dam Association (CDA) Dam Safety Guidelines and Technical Bulletin Nos. 1 through 9 provided primary guidance for design of the project including the hydraulic structures. Other recognized industry standards referenced in the AT/CDA Guidelines were used to supplement aspects of the design that the AT/CDA Guidelines do not address. Such references include the US Army Corps of Engineers (USACE) Engineering Manuals and US Bureau of Reclamation (USBR) Design Standards. In case of conflicting criteria, AT provisions were used unless a "more stringent" requirement was deemed appropriate based on engineering judgement.

Where referenced by AT and CDA, the Alberta Building Code (ABC) was used to obtain certain design loads (wind, snow, live, vehicle), and develop load combinations associated with strength and serviceability. ABC provisions were used primarily for evaluation of individual elements based on wind and snow loading. Otherwise loading was based on physical model testing, CFD modelling, and the debris assessment report.

The following codes, guidelines, and standards were identified for use on this project:

2.1 PROJECT STANDARDS

- Alberta Government, Terms of Reference (TOR0015997) for "Flood Mitigation Works, Springbank Off-Stream Storage Project (SR1) (WAC0078983), Addendum No. 2," August 1, 2014.
- AT's "Engineering Consultant Guidelines for Highway Bridge and Water Projects, Volume 1- Design & Tender" - 2011.
- AT's "Engineering Consultant Guidelines for Highway Bridge and Water Projects, Volume 2- Design & Tender" - 2011.
- AT's Civil Works Master Specifications for Construction of Provincial Water Management Projects.

2.2 DAM DESIGN AND SAFETY

- Province of Alberta Water Act – Water (Ministerial) Regulation - Regulation 205/98 (consolidated up to 185/2015).
- AT's "Water Control Structures Selected Design Guidelines" – Nov. 2004
- Canadian Dam Association Dam Safety Guidelines (CDA) 2007 with 2013 Revisions.
- CDA – Technical Bulletins:

3.0 PROJECT DATA

3.1 LOCATION

The project is located in the Springbank area of Rocky View County, Alberta, Canada, southwest of the City of Calgary in Township 24 (Range 04/03, W5M).

Latitude	51.050504 N
Longitude	114.401436 W
Elevation	1180 to 1220 m

3.2 FOUNDATION PARAMETERS

Site characterization is based on geologic assessment of the project site, exploratory borings, laboratory testing of project samples, and geotechnical engineering judgment. The Debris Deflection Barrier will bear on bedrock of the Brazeau Formation in the bed of the Elbow River. At this location, the Brazeau Formation consists of thin beds of steeply dipping, highly weathered and fractured claystone, mudstone, shale and sandstone. The bedrock conditions for use in design were established from a site-specific geotechnical exploration and the associated laboratory testing. The following foundation parameters, derived from Brazeau formation data, are described in the PDR, Appendix D - Geotechnical Assessment Report, Section 5.7.

Bedrock Unit Weight	25.6 kN/m^3	
Bedrock Friction Angle (Rock/Rock Interface) (φ)	26 Deg.	
Concrete/Rock Interface Friction Angle (φ)	26 Deg.	
Cross Bed Friction Angle (φ) – Passive Wedge	24 Deg.	
Ultimate Bearing Capacity (σ_{ult})	1915 kPa	
Allowable Bearing Capacity – Usual	1270 kPa	(σ_{ult}/1.5 $_{SF}$)
Allowable Bearing Capacity – Unusual	1470 kPa	(σ_{ult}/1.3 $_{SF}$)
Allowable Bearing Capacity – Extreme	1740 kPa	(σ_{ult}/1.1 $_{SF}$)

Cohesion: In accordance with CDA Guidelines Technical Bulletin No. 7 (Geotechnical) and Technical Bulletin No. 8 (Structural), cohesion was not included in the sliding stability analysis, and acceptance criteria is based on sliding factors for friction only resistance.

The foundation structure elements (caissons and spread footings) were configured based on the design parameters and the applied structure loading discussed later. A full description of the design process of the foundation elements is presented in PDR, Appendix D - Geotechnical Assessment Report, Section 10.5.

3.3 HYDROTECHNICAL PARAMETERS

Table 1 provides a summary of the hydrotechnical parameters used in the design.

Table 1. Elbow River Water Levels

Load Case	U/S Water Level (m)	D/S Water Level (m)
Usual Load Cases (Normal)		
U1 – Normal pool elevation (Sunny Day)	1211.5	1211.5
U2 – 1:100 Year Flood (760 m^3/s) with Log Impact Load	1215.8	1215.8
Unusual Load Cases		
UN1 – FoR (1240 m^3/s) with Vehicle Impact Load	1215.8	1215.8
UN2 – 1:100 Year Flood (760 m^3/s) with 33% Blocked	1216.05	1215.8
Extreme Load Cases		
E1 – 1:100 Year Flood (760 m^3/s) with 70% Blocked	1216.5	1215.8
E2 – Sunny Day with Seismic	1211.5	1211.5

3.4 CLIMATE DATA

3.4.1 Snow

Snow Load data for this project was obtained from Environment Canada and Alberta Building Code.

- Ground snow load, snow component (S_s) =1.7 kPa
- Ground snow load, rain component (S_r) =0.1 kPa
- Snow load, Importance factor (I_s) =1.25

3.4.2 Frost Considerations

Frost depth was determined in accordance with Alberta Building Code and is shown in PDR, Appendix D - Geotechnical Assessment Report.

- Minimum design frost depth of 2.0 m
- Non-frost susceptible backfill - Gravel and clean sands

3.4.3 Temperature Variations

Monthly temperature data for use in the evaluation was obtained from the Calgary International Airport records, which is considered representative of typical temperature ranges at the project site.

3.4.4 Wind

A wind load of 0.48 kPa was determined for use at the site based on the Alberta Building Code.

4.0 CONSTRUCTION MATERIALS

4.1 CONCRETE AND CONCRETE ACCESSORIES

- **Structural Concrete – Class A1**
  General use reinforced concrete where thermal control and volume change are not a concern.
  Minimum Compressive Strength: 30 MPa @ 28 days
  Mixture defined in Section 03300 – Concrete, AT Civil Works Specifications.

- **Foundation Concrete - Class F**
  15 MPa @ 28 days, (AT Civil Works Specifications)
  For use in foundation preparation such as mud mats and low strength fill.

- **Grout**
  Premixed structural non-shrink grout for equipment bases.

- **Preformed Expansion Joint Filler**
  ASTM D1752, Type I, Closed-cell sponge rubber.

- **Bond Breaker**
  Bituminous paint conforming to CGSB 37.2-88.

4.2 METALS

- **Steel Reinforcement - CAN/CSA-G30.18, Grade 400W deformed bars**
- **Structural Steel - CSA-G40.21, Grade 300W or 350W – Hot-dipped Galvanized**
- **Stainless Steel - ASTM A276**
- **Weathering Steel – ASTM A588, A242, A847, and A709-50W**
- **Miscellaneous Metals (ladders, handrails) - Galvanized steel**

4.3 EARTHWORK MATERIALS

The Debris Deflection Barrier will be constructed on the existing rock foundation. Soil backfill parameters are based on terminology in AT's Civil Works Master Specification 02330 – Earthwork Materials and described in the PDR, Appendix D - Geotechnical Assessment Report.

Design values for specified material include:

Impervious Fill

Unit Weight (-)	21 kN/m^3
Internal Friction Angle (-)	18 deg

Granular Fill

Unit Weight (-)	21 kN/m^3
Internal Friction Angle (-)	34 deg

Glacial Till

Unit Weight (-)	20 kN/m^3
Internal Friction Angle (-)	27 deg

Rock Fill

Unit Weight (-)	22 kN/m^3
Internal Friction Angle (-)	20 deg

Siltation (Equivalent Fluid)

Unit Weight Vertical (-)	19 kN/m^3
Unit Weight Horizontal (-)	13 kN/m^3

5.0 STRUCTURAL ANALYSIS APPROACH

For the purposes of analysis and structural design, the Debris Deflection Barrier was divided into a steel frame, and reinforced concrete base walls and foundation. Each component of the structure was evaluated, as applicable, for global stability, strength, and serviceability. Each element or member of the DDB was assessed for applicable imposed loads to which they may be subject per the governing code criteria.

Strength evaluation was used to verify size of critical components such as structural steel framing components, concrete walls, footing and caissons. Strength evaluation of individual concrete elements and members was performed to verify member sizes and reinforcement requirements in accordance with CSA A23.3-14 and as supplemented using CSA "Structural Design of Wastewater Treatment Plants 2018 for revisions addressing service load conditions, shrinkage and temperature reinforcement and crack control. Strength evaluations provided design values for sizing concrete reinforcement and joint doweling. A combination of Excel spreadsheets and SAP2000 software was used to generate shear and moment values for strength design of components. A three-dimensional finite element method (FEM) model consisting of steel framing elements and spring foundation loads was created to design the components. The FEM was supplemented with Excel calculations.

Serviceability includes limiting deflections, reducing crack potential, providing thermal stress relief, and incorporating measures to mitigate alkali-aggregate reaction (AAR). A combination of Excel spreadsheets, or commercial software were used to evaluate deflection and thermal effects. Finite Element Models (FEMs) were used to validate manual calculations, identify potential stress concentrations, and assess additional serviceability concerns such as localized deflection, need for thermal stress relief, and stress redistribution not captured in manual calculations. Design detailing and material specification were used to mitigate concrete cracking and AAR potential.

5.1 DESIGN TOOLS AND SOFTWARE

- Microsoft Excel - 2010 - version: 14.0.7166.5000
- Mathcad 15.0 - 2013 - version: MC15_M030_20131216
- SAP2000 Advanced -2019- version 21.0.2

6.0 LOADS

6.1 DEAD LOADS (D)

Permanent loads on the structure include structure weight and water. Unit weights for principal materials are included in Table 2.

Table 2. Dead Load and Unit Weights

Material	Unit Weight	Source
Water	9.81 kN/m^3	CSA S6-14, Table 3.4
Reinforced Concrete	23.5 kN/m^3	AT WCS Design Guide 4.2
Steel	77.0 kN/m^3	AT WCS Design Guide 4.2

6.2 HYDROSTATIC LOADS (H)

Both horizontal and vertical components of water load were based on the water surface elevation for the load condition considered. Upstream and downstream water surface elevations are described in Hydrotechnical Parameters, Section 3.3. The water surface elevations were considered to be hydrostatic pressures without kinematic effects. Headwater was considered the water surface elevation at the upstream face of the structure. Tailwater was considered the water surface elevation downstream of the DDB and upstream of the Diversion Inlet.

6.3 UPLIFT PRESSURE (U)

Uplift pressures were considered in the cross bedding failure plane as well as under the concrete walls depending on the stability section under review.

6.4 EARTH PRESSURE (E)

Soil loads include both vertical and horizontal forces due to backfill, sediment, and siltation. Since backfill does not vary from upstream to downstream, earth pressure was not considered for this structure except where scour was considered on upstream or downstream side of the DDB.

Vertical force associated with soil mass above the structure was included as dead load based on vertical projection of footing or structure below the soil. Soil mass was based on moist unit weight for material above waterline and buoyant unit weight for material below the waterline. Vertical force associated with water above the structure was calculated separate from the soil mass.

Horizontal force associate with soil were based on at-rest condition represented by the empirical relationship:

$K_o = 1 - \sin\theta$ where: K_o = At-rest lateral pressure coefficient(*)
θ = Soil friction angle

**In accordance with EM 1110-2-2100 and EM 1110-2-2502 to use At-Rest Coefficient (K_o)*

6.5 LIVE LOADS (V)

Live loads associated with occupancy, vehicles and equipment surcharges were considered insignificant compared to other transient loads and were not considered for the DDB.

6.6 HYDRODYNAMIC LOADS (HD)

The DDB alignment is oriented approximately parallel to the Elbow River to promote passage of debris downstream of the structure and through the Service Spillway. In addition, the physical model testing demonstrated that "flushing" debris from in front of the DDB through operation of the Service Spillway gates may be possible. However, the design of the DDB considered the possibility of debris to accumulate in front of the structure and the potential for loading on the structure from the drag forces acting upon the accumulation and transferred to the superstructure.

Drag force on the woody debris accumulations on the face of the rack was determined using the procedures described in the US Department of Transportation Federal Highway Administration's "Debris Control Structures – Evaluation and Countermeasures – Hydraulic Engineering Circular No. 9".

The drag force equation is sensitive to the drag coefficient which in-turn is sensitive to both blockage ratio and Froude Number. Because hydraulic and debris accumulation conditions in the backwater can be highly variable during operation, an envelope approach to the drag coefficients was employed in the design calculations by selecting combinations of blockage ratios and Froude numbers that could plausibly be present during operations. Table 3 provides the resultant drag coefficients from these combinations.

Drag force applied by water passing through the structure were considered in the design. For the "clean" barrier, drag from the structural members is computed using the Computational Fluid Dynamics (CFD) model results discussed in later sections. For debris blockage scenarios, the structure drag forces are assumed to be included with the debris drag force calculations. Table 3 shows the drag forces applied for each load case.

Table 3. Hydrodynamic and Drag Forces

Load Case	Hydrodynamic	Drag Force from Underside of Mat	Drag Force from Clogging
Usual Load Cases:			
U1	None	None	None
U2	1.0 KN/m	None	None
Unusual Load Cases:			
UN1	1.0 KN/m	None	None
UN2	None	66 kN/m acting on a 1.5 m band centered 0.75 m below the modeled water surface	Upper Rack = 2.1 kN/m Bottom Rack = 4.9 kN/m
Extreme Load Cases:			
E1	None	66 kN/m acting on a 1.5 m band centered 0.75 m below the modeled water surface	Upper Rack = 1.95 kN/m Bottom Rack = 4.55 kN/m
E2	None	None	None

6.7 DEBRIS AND IMPACT LOADS (IM)

Woody debris in transport can impact the DDB when the project is diverting floods. The impact forces were computed using the methods described in "Maximum Impact Force of Woody Debris on Floodplain Structures" (USACE 2002), specifically the one-degree of freedom model derived in that document.

The CFD model results suggest a velocity of approximately 3 m/s against the face of the rack when the project is diverting 600 m^3/s from a total flow on the Elbow River of 760 m3/s. Assuming an approach angle that is perpendicular to the barrier rack; and that the alignment of the design log is such that its butt-end contacts the rack first, the computed impact from the design log is 146 kN. This load is assumed to act on a single horizontal tube for Load Case U2.

The same one-degree of freedom model was used to estimate the impact forces from a heavy object entrained in the flow. A one-ton class truck was selected as surrogate for this object. Based on published base curb weight for a Ford F-350, the vehicle was assumed to have a weight of approximately 3084 kg (6800 lbs). The vehicle velocity was estimated at 3 m/s using the hydraulic model results which produces an impact force of 258 kN. This load was assumed to act on 3 of the horizontal tubes for the Load Case UN1. The debris and impact loading for the various load conditions is summarized in Table 4.

Table 4. Impact Forces

Load Case	Impact Force (IM)
Usual Load Cases (Normal)	
U1	None
U2	146 KN
Unusual Load Cases	
UN1	258 KN
UN2	None
Extreme Load Cases	
E1	None
E2	None

6.8 ICE LOAD(I)

Three types of ice load to consider for the DDB design include Static Ice Load (I_s), Dynamic Ice Loading (I_d), and Ice Accretion Load (I_v).

- **Static Ice Load (I_s)** is a result of water surface freezing with application of horizontal load as an ice sheet expands and confinement increases. Static Ice Loading has the potential to occur at low flow conditions. Static ice loading is applied in Usual Load Cases that address winter operating conditions.

- **Dynamic Ice Loading (I_d)** is a result of moving ice floe impacting the structure. Dynamic Ice Loading was not considered as a design load case because the Diversion Structure does not have a permanent pool.

- **Ice Accretion Load (I_v)** occurs when ice bonds to the structure and must be broken as water level rises. Ice Accretion Load associated with water level rise was not considered for the Diversion Structures including the DDB due to small order of magnitude relative to hydrostatic loading and low probability of occurring simultaneous with spring and summer flooding.

Frost Heave. Vertical ice loading associated with "frost heave" was considered. The structures are normally in a dewatered or low-water state with freeze/thaw action tending to open rock joints and concrete/rock interface and subject the structure to increased uplift potential. To minimize frost heave loading potential and remove this condition from the analysis, foundation interfaces were located below the identified frost depth of 2.0 m for this site and drainage provided to reduce the formation of ice in the foundation.

6.9 SEISMIC – EARTHQUAKE LOADS (Q)

The seismic classification for the Debris Deflection Barrier is based on Stantec's *Seismic Hazard Assessment - Springbank Off-Stream Dam and Reservoir Report* dated November 28, 2016. Since the hazard classification for this structure is Extreme (Off-stream Storage Dam) or High (Diversion Structure), the seismic parameters are based on an Earthquake Design Ground Motion (EDGM) with an Annual Exceedance Probability (AEP) of 1/10,000 resulting in Peak Ground Acceleration (PGA) of 0.26 g for horizontal application and PGA of 0.15 for vertical application.

This project site is situated in an area of low to moderate seismic activity. Consequently, CDA Guidelines, Section 6.5 allow for the seismic stability analysis of concrete gravity structures to be completed using a pseudo-static approach (coefficient method). This method applies a seismic force to a rigid body with the objective of determining sliding and overturning response of the structure. Since the pseudo-static method does not recognize the oscillatory nature of seismic loads, accepted practice is to perform the stability calculations using sustained acceleration values equivalent to 2/3 of the peak acceleration values.

When performing concrete stress analyses, the objective is to determine the tensile crack length induced by the inertia forces applied to the structure, so peak acceleration is used to calculate seismic coefficients. This approach assumes an instantaneous acceleration spike can induce cracking but is not sustained long enough to develop significant displacement along the crack plane. If no significant displacement occurs, the dynamic stability is maintained.

6.9.1 Seismic Effects on Concrete Mass

The horizontal force required to accelerate the concrete mass is calculated as:

$Q_h = k_h \times W$ where:

Q_h = Horizontal seismic load (kN)
k_h = Horizontal seismic coefficient
W = Structure mass (kg)
PGA = Peak ground acceleration= 0.26g

For Stability Analysis (Table 5): k_h = 2/3 x 0.26 = 0.17
For Member Analysis (Table 6): k_h = 1.0 x 0.26 = 0.26

The vertical force required to accelerate the concrete mass is calculated as:

$Q_v = k_v \times W$ where:

Q_v = Vertical seismic load (kN)
k_v = Horizontal seismic coefficient = 0.56*k_h
W = Structure mass (kg)

For Stability Analysis (Table 5): k_v = 2/3 x (0.56*k_h) = 0.10
For Member Analysis (Table 6): k_v = 1.0 x (0.56*k_h) = 0.15

Since an earthquake produces oscillating forces, the peak horizontal PGA and vertical PGA cannot occur at the same time. To account for this in the stability calculations, three separate combinations of vertical and horizontal seismic combinations were considered, but only the maximum value was reported. The three combinations of vertical and horizontal seismic load are as follows:

Table 5. Stability Analysis – Seismic Coefficients

Seismic Combination	Horizontal	Vertical
100% Horiz., No Vert.	1.0*k_h = 0.17	-
100% Horiz., 30% Vert.	1.0*k_h = 0.17	0.3*k_v = 0.03
30% Horiz., 100% Vert.	0.3*k_h = 0.05	1.0*k_v = 0.10

Table 6. Stress Analysis – Seismic Coefficients

Seismic Combination	Horizontal	Vertical
100% Horiz., No Vert.	1.0*k_h = 0.26	-
100% Horiz., 30% Vert Horiz.	1.0*k_h = 0.26	0.3*k_v = 0.05
30% Horiz., 100% Vert.	0.3*k_h = 0.08	1.0*k_v = 0.15

6.9.2 Seismic Effects on Water (H_E)

Using a pseudo-static method, hydrodynamic effects on water were approximated by using the Westergaard method to calculate the seismic water force (H_E). The calculated hydrodynamic force is additive to the hydrostatic water pressure force. The distribution is parabolic with the line of action for the force H_E at 0.4h above the base of the water column. Detailed explanation of method can be found in Section 4-7.e, EM 1110-2-2100.

$$H_E = \left(\frac{7}{12}\right) * k_{h/v} * \gamma_w * h^2$$

where:
H_E = Seismic water force (kN)
$k_{h/v}$ = horizontal/vertical seismic coefficient
γ_w= unit weight of water (kN/m³)
h = depth of water (m)

Note: The Westergaard method assumes an infinite waterbody length in the horizontal direction, which is a reasonable simplifying assumption for most conditions. For the unique case where seismic acceleration of water in the cross-stream direction is considered to evaluate divider walls and training walls, the Westergaard method will conservatively overestimate the hydrodynamic force.

6.9.3 Seismic Effect on Soils

Dynamic soil pressures and associated forces were analyzed assuming non-yielding backfills and an elastic response using the Wood's method. As referenced in Section 5-5.a.1, EM 1110-2-2100, and verified by project specific calculation (Appendix D), this method can be expected to have dynamic soil pressures greater than those predicted by the Mononobe-Okabe method for yielding backfills.

The use of Wood's method is considered reasonable and was used for analysis of fill around the concrete foundation structure that has relatively low backfills (<4 m). The use of Wood's method may be overly conservative for taller retaining walls with height ranging from 4 m to 13 m with backfill consisting of granular fills and/or glacial till materials.

Wood's Method for Non-yielding Backfill: This method applies the effective peak ground acceleration coefficient (k_h) to the soil mass to calculate a lateral seismic force representing dynamic soil pressure effects. The lateral seismic force is assumed to act at a distance of 0.63h above the base of the wall and must be added to the lateral inertial forces, and if water is present, hydrodynamic seismic forces. Calculation of lateral seismic force of soil is as follows:

$Q_E = y * h^2 * k_h$ where: Q_E = Lateral seismic force of soil
Y = unit weight of soil (weighted average of Y_{sat} and y_b)
h^2 = height of backfill
k_h = horizontal seismic coefficient

6.10 CLIMATIC CONDITIONS

6.10.1 Snow Loads (S)

Snow loads were considered insignificant compared to hydrostatic loads and were not considered for the DDB.

6.10.2 Thermal Loads (T)

Thermal effects and measures, such as placement of expansion/contraction joints in concrete structures, to relieve thermal loads will be addressed during Final Design.

6.10.3 Wind (W)

Wind loads were applied to the DDB on load combination U1 only. The loads applied were based on the climate data shown in Section 3.4.

7.0 STABILITY ANALYSIS

The Debris Deflection Barrier was analyzed for stability for loading conditions in accordance with AT WCS, CDA Guidelines and CSA standards.

7.1 METHODOLOGY

The structural analysis of the DDB was completed based on a strength evaluation and design. Since the structure is supported by a continuous footing and caissons, a rigid body method was not used in the analysis.

All forces applied to the structure were computed and analyzed depending on the load case using a three-dimensional structural analysis model. The foundation was then designed to resist the force resultant at the foundation/rock interface.

7.2 LOAD CONDITIONS

The load combinations considered were coordinated with the Stantec Hydraulics group and are described in Table 7. The different load factors are also represented.

Table 7. Load Combinations

Usual Load Cases:		
U1	Normal pool (Sunny day)	1.25D+1.5H+1.5W+1.25E
U2	1:100 Year, 760 m^3/s	1.25D+1.5H+1.5HD+1.25E+1.5IM
Unusual Load Cases:		
UN1	1:250 Year, 1240 m^3/s	1.25D+1.5H+1.5HD+1.25E+1.5IM
UN2	1:100 Year, 760 m^3/s	1.25D+1.5H+1.5HD+1.25E
Extreme Load Cases:		
E1	1:100 Year, 760 m^3/s	1.25D+1.5H+1.5HD+1.25E
E2	Sunny day with seismic	1.25D+1.5H+1.25E+1.0Q
Notes:		
D	Dead Load: Weight of concrete and water	
H	Hydrostatic Load: See each load case for headwater and tailwater conditions	
HD	Hydrodynamic Loads: Not applicable for this analysis	
E	Earth/Sediment/Silt Loads: Includes horizontal and vertical loads	
IM	Impact Load: Debris carried by flow, applied 150 mm below top of wall	
Q	Seismic Loads: Design Earthquake load – evaluation to consider simultaneous horizontal and vertical components for three combinations	
W	Wind Loads: Used for Strength Analysis only – Not Applicable to Stability	

7.3 SUMMARY OF STABILITY ANALYSES

The structural analysis resultants based on strength evaluation were used to perform a static stability assessment rather than using the rigid body method (conventional gravity method). Refer to Section 8.0 for a summary of the structural analysis.

Table 8 shows a summary of the forces applied to the structure and the safety factors used for the foundation structure design. The summation of the vertical forces was compensated by the vertical resistance of the caissons and footing, resulting in a structure that is stable against floatation. The summation of the horizontal forces is compensated by the horizontal resistance provided by the bedrock in which the foundation will be installed in and it results in a structure that is stable for sliding.

This analysis is comparable to the stability analysis and the safety factors shown are a result of the design of the foundation to resist the forces applied to the structure. The safety factors are higher than CDA values since the design of the foundation was done using a strength evaluation method. The stability requirements of CDA, as used for gravity dam structures, were used as a guide, as they are not applicable to the DDB since it is not a dam,

Table 8. Stability Summary

Load Comb.	Σ Vert. Forces (KN)	Σ Horiz. Forces (KN)	Σ Moments (KN*m)	Minimum Required Floatation FS	Floatation SF Calc.	Minimum Required Sliding FS	Sliding FS Calc.

8.0 STRENGTH EVALUATION AND DESIGN

Strength evaluation of individual elements or members of the structure was used to verify member sizes based on application of factored loads as described in ABC with some adjustments for more severe conditions or loads not included in the ABC.

Reinforced concrete design of the foundation structure was performed according to Design of Concrete Structures, CSA A23.3-14 with the additional requirements of CSA's SEED Document – *Structural Design of Wastewater Treatment Plants-2018* that addresses service load conditions, water tightness, shrinkage and temperature reinforcement, and crack control. The SEED Document contains references to ACI 350M-06 for modifying CSA A23.3-14.

Structural steel design was performed according to Design of Steel Structures, CSA S16-14, and codes for welding, materials, and other pertinent references.

In general, structural analysis and design was performed using SAP2000 and Excel spreadsheets. The Three-Dimensional Finite Element Model (FEM) was used to evaluate multiple load combinations, identify stress concentrations, and generate shear and moment values for design of individual elements. The FEM was supplemented with manual calculations to verify/validate model results and where necessary, refine the analysis of individual elements. Based on model output, a combination of manual calculation and commercial software were used for strength design. Additional elements evaluated as part of strength design included joint detailing, equipment anchorage, and embedded parts.

The structural design calculations for the concrete foundation and steel framing can be found in Appendix E.6-2.

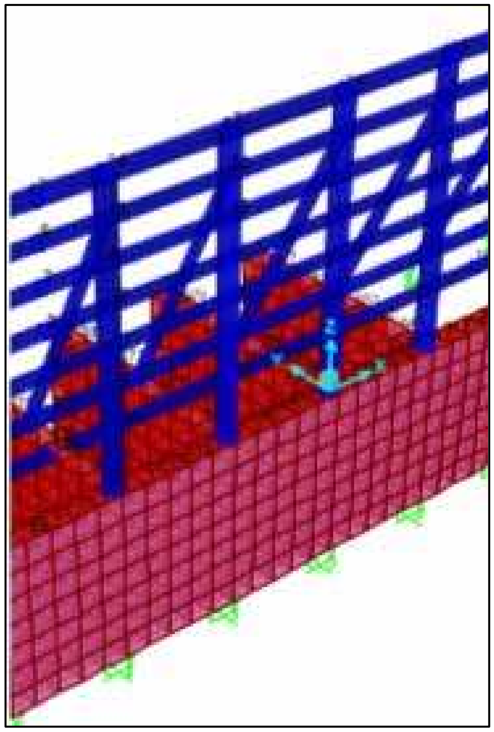

Figure 2. SAP2000 Model Frame of Barrier

9.0 SERVICEABILITY

Serviceability concerns with the Debris Deflection Barrier foundation relate primarily to concrete durability including limiting deflections, reducing crack potential, providing thermal stress relief, and incorporating measures to mitigate alkali-aggregate reaction (AAR) and other chemical attack. The same manual calculations, commercial software, or 3-D FEM used for strength evaluation were used to evaluate deflection and thermal growth, while design detailing and material specification were used to mitigate cracking and chemical attack.

Serviceability concerns with the Debris Deflection Barrier steel superstructure relate primarily to steel longevity, and ability to maintain and service the DDB, particularly following a flood evert. Steel longevity considerations include paint or galvanizing coatings for wet and dry conditions, sealing of internal chambers to eliminate oxygen, or the use of weathering steel for the members. The maintenance and servicing of the DDB was addressed by using modular construction with standardized parts and fabrication using exposed connections for ease in replacement if damaged.

10.0 CONSTRUCTION CONSIDERATIONS

Construction specifications and details for the Debris Deflection Barrier will be furthered during Final Design. The following construction considerations are noted:

- Dewatering of excavated areas will be required to sufficiently enable construction of the Debris Deflection Barrier. The services of a specialist dewatering contractor may be needed.

- Excavation will be to competent bedrock. All soil, including alluvium, talus and other unconsolidated deposits should be removed to expose unweathered or slightly weathered bedrock. Excavation should be performed by mechanical means only; blasting will not be permitted.

- Foundation preparation will require special care in cleaning and preparation of concrete/rock interface. Care must be taken during excavation of the foundation to identify unsuitable rock conditions or weak bedding planes that could impact stability. Loose material and rock overhangs will need to be removed. Small voids will be filled with dental concrete.

- Shear keys are required to maintain adequate sliding stability. Care should be taken during excavation of the shear key trenches to identify unsuitable rock conditions or weak beading planes that could compromise capacity of the shear key.

- Concrete placement will require sequencing for construction of upstream intermediate walls between piles.

- Fill placement and compaction methods must be reviewed and monitored to ensure wall movement does not occur during construction.

- Construction sequencing will be required to ensure the Debris Deflection Barrier is fully functional before a tie-in with the Diversion Channel is made.

UN2 – 1:100, Yr, 760 cms	Small to Medium Debris Mat	1216.05	1215.80	0	0	66 kN/m acting on a 1.5 m band centered 0.75 m below the modeled water surface	Upper Rack = 2.1 Kn/m Bottom Rack = 4.9 KN/m	33% blocked with 140 m wide continuous floating mat
Extreme Load Cases								
E1 – 1:100 Yr, 760 cms	Large Debris Matt	1216.5	1215.8	0	0	66 kN/m acting on a 1.5 m band centered 0.75 m below the modeled water surface	Upper Rack = 1.95 KN/m Bottom Rack = 4.55 KN/m	70% blocked with 140 m wide continuous floating mat
E2 – Sunny Day with Seismic	None	1211.5	1211.5	0	0	0	0	

Based on table 1, the Usual Condition includes two load cases:

U1: Sunny Day with Wind Load

- Water Surface Elevation: 1211.5 m
- Wind Load: 0.48 kPa per Alberta Building Code (2014);

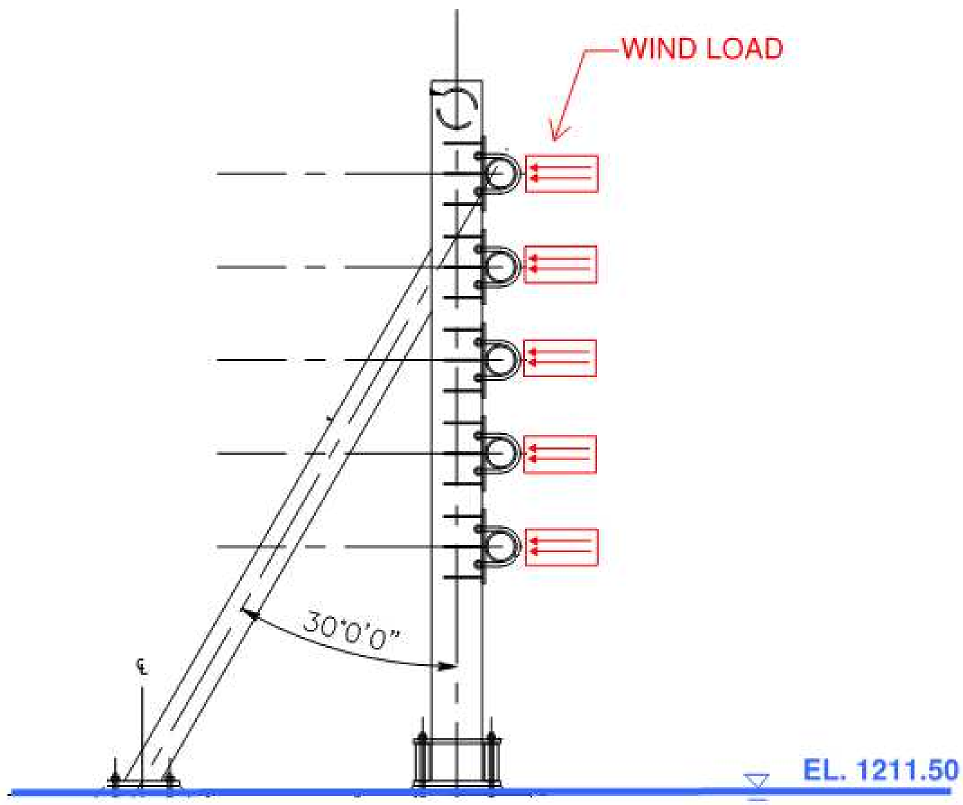

Figure 1 – Usual Load Case – No Flood with Wind

U2: 1:100 Year Flood Event with an Impact Load:

- Water Surface Elevation: U/S 1215.8 m, D/S 1215.8m
- Log Impact:
  - Design Log: 16m x 0.44m; Density = 900 KG/m³
  - Velocity: 3 metres per second

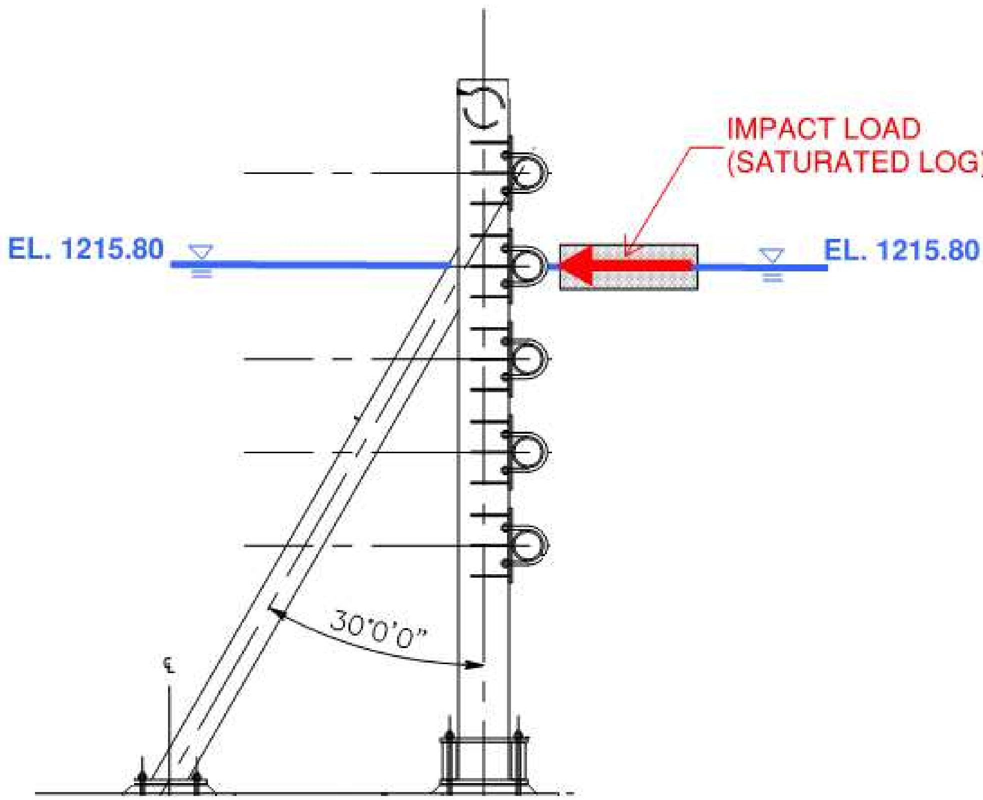

Figure 2 – Usual Load Case – 1:100 Year Flood with Log Impact

For the Unusual Condition, the primary load cases include:

UN1: 1:250 Year Flood Event with an Impact Load:

- Water Surface Elevation: TBD
- Vehicle Impact:
  - Design Vehicle: 3085 kg
  - Velocity: 3 metres per second

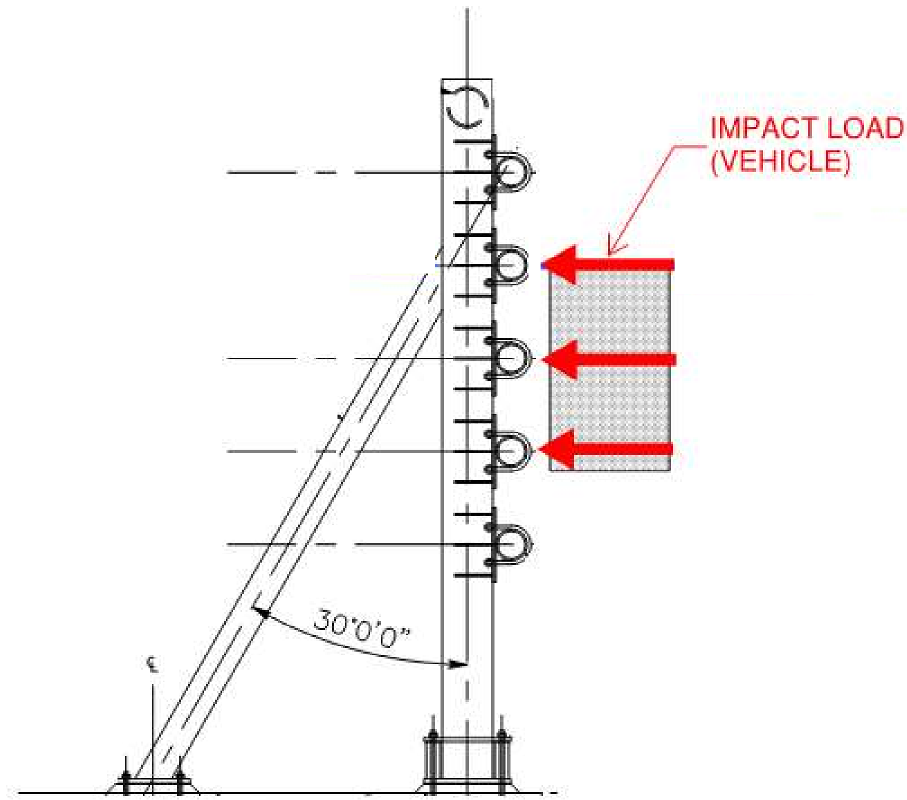

Figure 3 – Unusual Load Case – 1:250 Year Flood with Vehicle Impact

UN2: 1:100 Year Flood Event with 33% Debris Blockage:

- Water Surface Elevation: U/S 1216.05 m, D/S 1215.80 m
- Debris Blockage: 33%
- Floating Debris Mat Length: 140 m

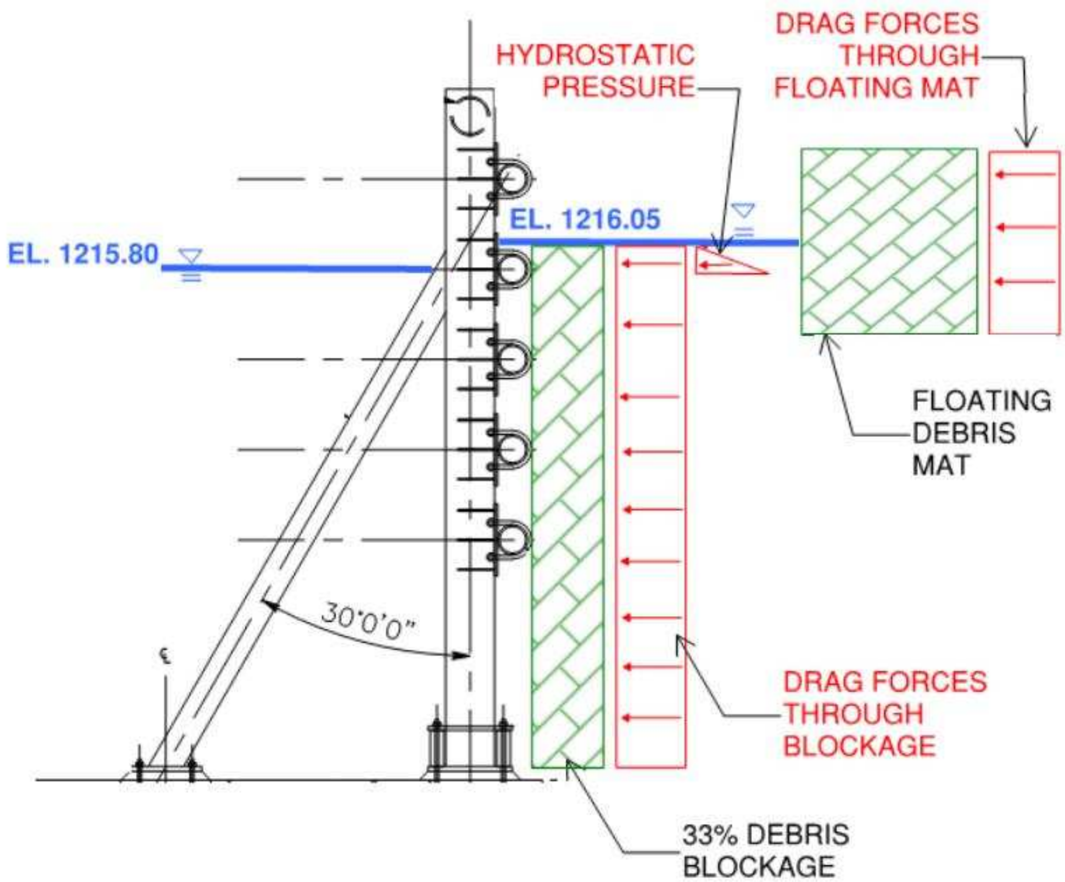

Figure 4 – Unusual Load Case – 1:100 Year Flood with 33% Debris Blockage

For the Extreme Load Case, the following condition was evaluated:

E1: 1:100 Year Flood Event with 70% Debris Blockage:

- Water Surface Elevation: U/S 1216.05 m, D/S 1215.80 m
- Debris Blockage: 70%
- Floating Debris Mat Length: 140 m

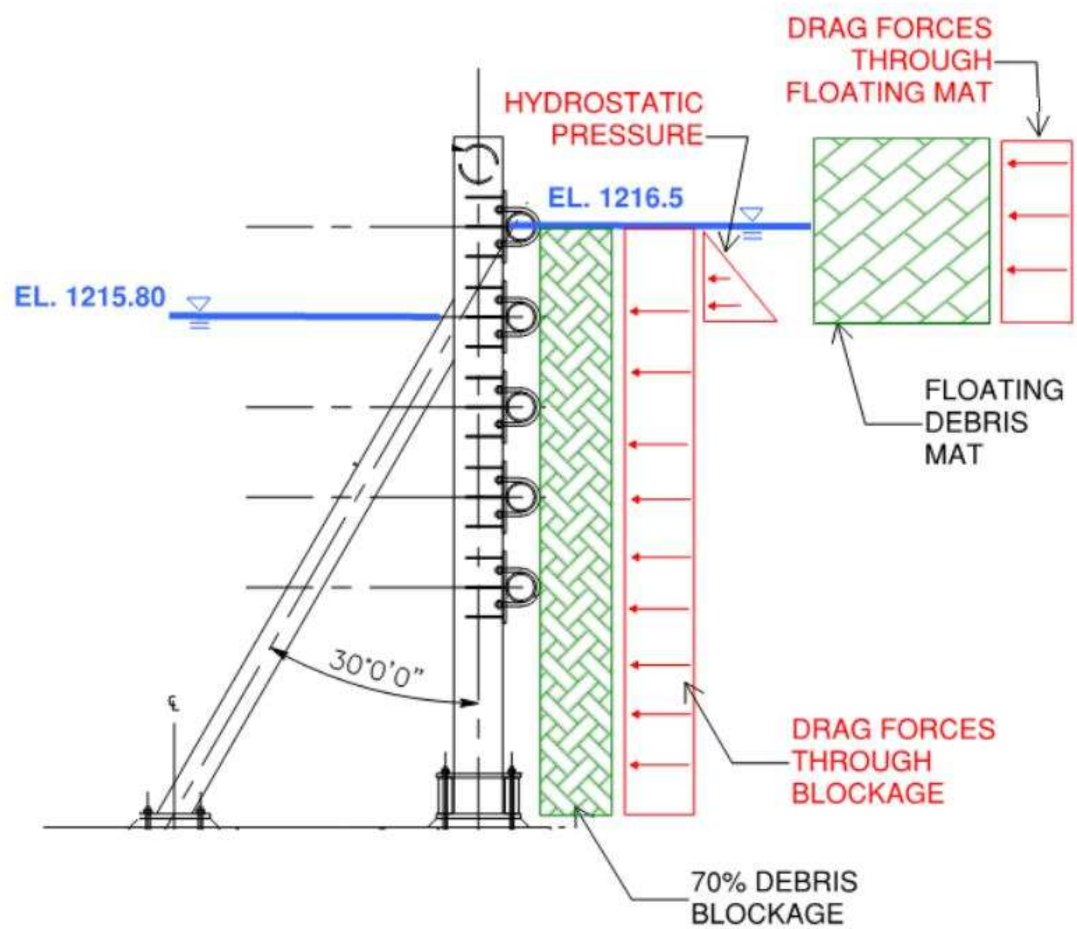

Figure 5 – Unusual Load Case – 1:100 Year Flood with 70% Debris Blockage

Table 2. Load Factors and Combinations for Structural Analysis

RESISTING MOMENT (due to Eq 'RMEQ') = 0	kN-m
TOTAL VOLUME CONCRETE = 30	m³

applied as an area load (0.5m down) onto parrallel wall and perpendicular wall

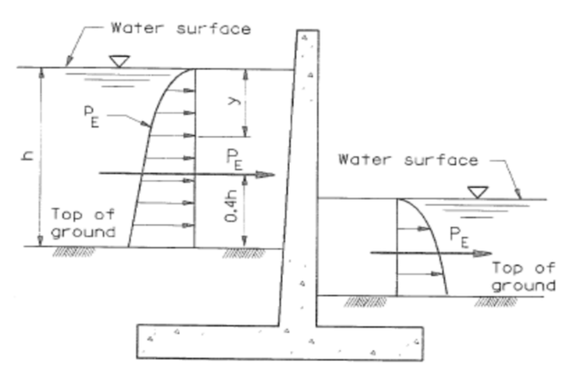

Figure 3-39. Hydrodynamic forces for freestanding water

Theory:
Using Earthquake formula: *(From Design of small dams)*
Pe = C λ w h (Increase in water pressure) Force = Ve = 0.726*Pe*y
C = Cm /2 (y/h (2- y/h) + sqrt(y/h(2-y/h))) = Moment = Me = 0.299 Pe y^2 = 0.4118 Ve y
(Dimensional coeff. giving distribution and magnitudes of pressures.)
λ = Earthquake intensity (ratio to acc due to gravity)
w = unit wt of water
Cm = (for verical faces) = 0.728 (refer charts)
Hence, C = 0.728 for y /h = 1 (overturning point at bottom of reservoir)

7. Design preferences

This section provides the design preferences for each type of design, which typically include material reduction factors, framing type, stress ratio limit, deflection limits, and other code specific items.

7.1. Steel design

Reviewed by: BEF on 10/29/2019

CONCLUSION

All calculations were based on the loading shown on the first part of this package.

Based on the calculations presented as well as the SAP2000 model results, the structure designed is able to sustain the loads included.
